# Chapter 1

## Selmer structures

### 1.1 Local cohomology and Kolyvagin primes

**Notation 1.1.1.** Let  $K$  be a number field. Fix an algebraic closure  $\overline{K}$  of  $K$ . For every finite extension  $F/K$ , denote its absolute Galois group by  $G_F = \text{Gal}(\overline{K}/F)$ .

**Assumption 1.1.2.** Let  $R$  be a local, artinian and self-injective ring with maximal ideal  $\mathfrak{m}$  and finite residue field  $k$  of characteristic  $p \geq 5$ . Let  $T$  be an  $R[[G_K]]$ -module, which is free and finitely generated as an  $R$ -module and is only ramified at finitely many primes.

**Notation 1.1.3.** (Duality) We will use the following duals of  $T$

$$T^\vee = \text{Hom}(T, \mathbb{Q}_p/\mathbb{Z}_p), \quad T^* = \text{Hom}(T, \mu_{p^\infty}), \quad T^+ = \text{Hom}(T, R)$$

**Notation 1.1.4.** We denote by  $K(T)$  to the minimal Galois extension such that  $G_{K(T)}$  acts trivially on  $T$ . Let  $M$  be the minimal  $n \in \mathbb{N}$  such that  $p^n R = 0$  and let  $K(1)$  be the maximal  $p$ -extension inside the Hilbert class field of  $K$ . Denote

$$K_M = K(\mu_M, (\mathcal{O}_K^\times)^{1/M})K(1), \quad K(T)_M = K(T)K_M$$

We assume the following assumptions:

**Assumption 1.1.5.** We assume the following assumptions:

- (T1)  $T/\mathfrak{m}T$  is an irreducible  $k[[G_K]]$ -module.
- (T2) There exists  $\tau \in G_{K_M}$  such that  $T/(\tau - 1)T \cong R$  as  $R$ -modules.
- (T3)  $H^1(K(T)_M/K, T) = H^1(K(T)_M/K, T^*) = 0$ .

**Remark 1.1.6.** Assume that the homomorphism  $\rho : G_{\mathbb{Q}} \rightarrow \text{Aut}(T) \cong GL_{\text{rank}(T)}(R)$  induced by the Galois action is surjective. Then all three Assumptions 1.1.5 hold. Indeed, (T1) and (T2) are clear.

For (T3), note that the order of  $R^\times$  is divisible by  $p - 1$ . It implies that the order of  $GL_{\text{rank}(T)}(R)$  and, therefore, the order of  $\text{Gal}(K(T)_M/K)$ , are also divisible by  $p - 1$ .

Then there is a subgroup  $\Delta \subset \text{Gal}(K(T)_M/K)$  of order  $p-1$ . For every  $A \in \{T, T^*\}$ , there is an inflation-restriction exact sequence

$$0 \longrightarrow H^1(\text{Gal}(K(T)_M/K)/\Delta, A^\Delta) \longrightarrow H^1(K(T)_M/K, A) \longrightarrow H^1(\Delta, A)$$

Note that the first cohomology group vanishes since  $A^\Delta = 0$  and the third one is also zero since the order of  $\Delta$  is prime to  $p$ . Therefore,  $H^1(K(T)_M/K, A)$  needs to be zero.

There is a set of primes playing a crucial role in this theory.

**Definition 1.1.7.** A prime  $q$  is said to be a *Kolyvagin prime* if  $\text{Frob}_q$  is conjugate to  $\tau$  in  $\text{Gal}(K(T)_M/K)$ .

**Notation 1.1.8.** We define the following sets:

- $\mathcal{P}^{(R)}$ : set of Kolyvagin primes.
- $\mathcal{N}^{(R)}$ : set of square-free product of Kolyvagin primes.
- $\mathcal{N}_i^{(R)}$ : set of square-free products of  $i$  Kolyvagin primes.

When there is no risk of confusion, we will drop the reference to  $R$ .

The reason to choose these primes is that we can control its local cohomology, since the finite and singular cohomology groups, defined below, are free cyclic  $R$ -modules.

**Definition 1.1.9.** (Finite cohomology) Let  $\ell$  be a finite place of  $K$ , not dividing  $p$ . Assume  $T$  is unramified at  $\ell$ . The *finite cohomology* group at  $\ell$  is defined as

$$H_f^1(K_\ell, T) := H^1(K_\ell^{\text{ur}}, T) = \ker\left(H^1(K_\ell, T) \rightarrow H^1(\mathcal{I}_\ell, T)\right)$$

where  $K_\ell^{\text{ur}}/K$  is the maximal unramified extension of  $K$ ,  $\mathcal{I}_\ell$  is the inertia subgroup of  $G_{K_\ell}$ , and the second equality follows from the inflation-restriction sequence.

comment on finite cohomology for other primes

**Definition 1.1.10.** Let  $\ell$  be a finite place of  $K$  as in Definition 1.1.9. The *singular cohomology* at  $\ell$  is the quotients

$$H_s^1(K_\ell, T) = H^1(K_\ell, T) \Big/ H_f^1(K_\ell, T)$$

When  $\ell$  is a Kolyvagin prime, the singular cohomology can be also identified with a subgroup of  $H^1(K_\ell, T)$ .

**Proposition 1.1.11.** ([MR04, Lemma 1.2.1]) If  $\ell \in \mathcal{P}$ , the canonical short exact sequence

$$0 \longrightarrow H_f^1(K_\ell, T) \longrightarrow H^1(K_\ell, T) \longrightarrow H_s^1(K_\ell, T) \longrightarrow 0 \quad (1.1)$$

splits canonically. Moreover, there exist isomorphisms of free cyclic  $R$ -modules

$$H_f^1(K_\ell, T) \cong T/(\tau-1)T, \quad H_s^1(K_\ell, T) \cong T^{\tau=1}$$

**Remark 1.1.12.** The first isomorphism is canonical from the identification

$$H_f^1(K_\ell, T) \cong T/(\text{Frob}_\ell - 1)T \cong T/(\tau - 1)T$$

However, the second one is only canonical after tensoring with the Galois group  $\mathcal{G}_\ell = \text{Gal}(K(\ell)/K(1))$ , where  $K(\ell)$  is defined as the maximal  $p$ -extension inside the ray class field modulo  $\ell$ . Following [MR04, Lemma 1.2.1]:

$$H_s^1(K_\ell, T) \otimes_{\mathbb{Z}} \mathcal{G}_\ell \cong \text{Hom}(\mathcal{I}_\ell, T^{\text{Frob}_\ell=1}) \otimes \mathcal{G}_\ell \cong T^{\text{Frob}_\ell=1} \cong T^{\tau=1}$$

**Definition 1.1.13.** Let  $\ell \in \mathcal{P}$ . The transverse cohomology subgroup is defined as

$$H_{\text{tr}}^1(K_\ell, T) := H^1(K(\ell)_\ell/K_\ell, T^{G_{K(\ell)_\ell}}) \hookrightarrow H^1(K_\ell, T)$$

**Proposition 1.1.14.** ([MR04, Lemma 1.2.4])  $H_{\text{tr}}^1(K_\ell, T)$  is the image of the canonical splitting in Equation (1.1). Note it is canonically isomorphic to  $H_s^1(K_\ell, T)$ .

There is a canonical comparison isomorphism between the finite and the singular cohomology at a Kolyvagin prime  $\ell$ .

**Proposition 1.1.15.** ([MR04, Lemma 1.2.3]) Let  $\ell \in \mathcal{P}$ . Then there is a canonical isomorphism, known as *finite-singular map*,

$$\varphi_\ell^{\text{fs}} : H_f^1(K_\ell, T) \rightarrow H_s^1(K_\ell, T) \otimes \mathcal{G}_\ell$$

**Notation 1.1.16.** In order to simplify notation, we fix once and for all, and for each Kolyvagin prime  $\ell \in \mathcal{P}$ , a generator  $\tau_\ell$  of  $\mathcal{G}_\ell$ . This choice, together with the finite singular map, fixes an isomorphism between  $H_f^1(K_\ell, T)$  and  $H_s^1(K_\ell, T)$ .

The finite and transverse cohomology groups behave well under local Tate duality.

**Proposition 1.1.17.** (Local Tate duality) There is a perfect pairing

$$H^1(K_\ell, T) \times H^1(K_\ell, T^*) \rightarrow \mathbb{Q}_p/\mathbb{Z}_p$$

Under this pairing,

- $H_f^1(K, T)$  and  $H_f^1(K, T^*)$  are annihilators of each other.
- $H_{\text{tr}}^1(K, T)$  and  $H_{\text{tr}}^1(K, T^*)$  are annihilators of each other.

## 1.2 Selmer modules

In this section, we introduce the concepts of Selmer structures and their associated Selmer modules. They are subgroups of the Global Galois cohomology which are cut out by local conditions. They can be used to determine the structure of important arithmetic objects like class groups of number fields or Mordell-Weil groups of abelian varieties.

**Definition 1.2.1.** A *Selmer structure*  $\mathcal{F}$  on  $T$  is a collection of the following data:

- A finite set  $\Sigma(\mathcal{F})$  of places of  $K$ , including all archimedean and  $p$ -adic primes and all the primes where  $T$  is ramified.
- For every  $\ell \in \Sigma(\mathcal{F})$ , a choice of an  $R[[G_{K_\ell}]]$ -submodule

$$H_{\mathcal{F}}^1(K_\ell, T) \subset H^1(K_\ell, T)$$

This choice is known as *local condition* at  $\ell$ .

**Definition 1.2.2.** The *Selmer module* associated to a Selmer structure is

$$H_{\mathcal{F}}^1(K, T) = \ker \left( H^1(K^\Sigma/K, T) \rightarrow \prod_{\ell \in \Sigma} H^1(K_\ell, T) \right)$$

where  $K^\Sigma/K$  is the maximal extension unramified outside  $\Sigma$  and the map is the composition of inflation and restriction map

**Remark 1.2.3.** When  $\ell \notin \Sigma(\mathcal{F})$ , we say the local condition at  $\ell$  is

$$H_{\mathcal{F}}^1(K_\ell, T) = H_f^1(K_\ell, T)$$

Under this identification, the Selmer module only depends on the local conditions, and not on the set  $\Sigma(\mathcal{F})$ , being

$$H_{\mathcal{F}}^1(K, T) = \ker \left( H^1(K, T) \rightarrow \prod_{\ell \in \mathbb{P}} H^1(K_\ell, T) \right)$$

In order to compare Selmer structures, Poitou-Tate global duality is helpful. In order to introduce the global duality exact sequence, we need to introduce the concept of dual Selmer structure.

**Definition 1.2.4.** (Dual Selmer structure) If  $\mathcal{F}$  is a Selmer structure defined on  $T$ , there is a *dual Selmer structure* defined on  $T$  by the data

- $\Sigma_{\mathcal{F}^*} = \Sigma_{\mathcal{F}}$
- For  $\ell \in \Sigma$ ,  $H_{\mathcal{F}^*}^1(K_\ell, T)$  is defined to be the annihilator of  $H_{\mathcal{F}}^1(K_\ell, T)$  under the pairing in Proposition 1.1.17.

**Proposition 1.2.5.** ([MR04, theorem 2.3.4]) Let  $\mathcal{F}$  and  $\mathcal{G}$  be Selmer structures of  $T$  such that  $H_{\mathcal{F}}^1(K_\ell, T) \subset H_{\mathcal{G}}^1(K_\ell, T)$  for every prime  $\ell$ . Then the following sequence, where the third map is induced by proposition 1.1.17, is exact.

$$H_{\mathcal{F}}^1(K, T) \hookrightarrow H_{\mathcal{G}}^1(K, T) \longrightarrow \bigoplus_{\ell \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}} \frac{H_{\mathcal{G}}^1(K_\ell, T)}{H_{\mathcal{F}}^1(K_\ell, T)} \longrightarrow H_{\mathcal{G}}^1(K, T^*)^\vee \twoheadrightarrow H_{\mathcal{F}}^1(K, T^*)^\vee$$

**Notation 1.2.6.** Let  $\mathcal{F}$  and  $\mathcal{G}$  be Selmer structures. We say  $\mathcal{F} \leq \mathcal{G}$  if

$$H_{\mathcal{F}}^1(K_\ell, T) \subset H_{\mathcal{G}}^1(K_\ell, T) \quad \forall \ell \in \mathcal{P}$$

Local conditions propagates naturally to submodules and quotients of  $T$ .

**Definition 1.2.7.** (Propagation to submodules) Let  $T' \hookrightarrow T$  be a submodule. This inclusion induces a map

$$\mu : H^1(K, T') \rightarrow H^1(K, T)$$

A local condition at  $T$  propagates to  $T'$  as

$$H_{\mathcal{F}}^1(K_{\ell}, T') = \mu^{-1}(H_{\mathcal{F}}^1(K_{\ell}, T))$$

**Definition 1.2.8.** (Propagation to quotients) Let  $T \twoheadrightarrow T''$  be a quotient map. It a map

$$\varepsilon : H^1(K, T) \rightarrow H^1(K, T'')$$

A local condition at  $T$  propagates to  $T''$  as

$$H_{\mathcal{F}}^1(K_{\ell}, T'') = \varepsilon(H_{\mathcal{F}}^1(K_{\ell}, T))$$

**Remark 1.2.9.** Let  $T_1 \subset T_2 \subset T$  be two submodules of  $T$ . The propagation of a local condition to the subquotient  $T_2/T_1$  is independent of the order in which we perform the operations.

With the definition of the propagation of Selmer structures, we can compare the Selmer groups of submodules with the torsion of the Selmer group.

**Proposition 1.2.10.** ([MR04, Lemma 3.5.3], [BSS18, Proposition 3.5]) Under Assumptions 1.1.5, for every ideal  $I$  of  $R$ , the inclusion  $T^*[I] \hookrightarrow T^*$  induces an isomorphism

$$H_{\mathcal{F}}^1(K, T^*[I]) \cong H_{\mathcal{F}}^1(K, T^*)[I]$$

In this theory, it is required to impose a technical condition on the Selmer structures that guarantees good behaviour under the propagation.

**Definition 1.2.11.** (Cartesian Selmer structure) A Selmer structure  $\mathcal{F}$  is said to be *cartesian* if the map

$$H_{/\mathcal{F}}^1(K_{\ell}, T \otimes k) \rightarrow H_{/\mathcal{F}}^1(K_{\ell}, T)$$

is injective for every prime  $\ell$ .

**Remark 1.2.12.** It is enough to check the cartesian condition for  $\ell \in \Sigma_{\mathcal{F}}$ . Indeed, when  $\ell \notin \Sigma_{\mathcal{F}}$ , then

$$H_{\mathcal{F}}^1(K_{\ell}, T) = H_{\mathfrak{f}}^1(K_{\ell}, T) \Rightarrow H_{\mathcal{F}}^1(K_{\ell}, T) = H_{\mathfrak{s}}^1(K_{\ell}, T) = \text{Hom}(\mathcal{I}_q, T^{\text{Frob}_{\ell}=1})$$

which is a cartesian local condition because  $\text{Hom}$  is a left exact functor.

When the Selmer structure is cartesian, the Selmer group of some quotients of  $T$  can be also identified with the torsion of the Selmer group.

**Proposition 1.2.13.** Assume Assumptions 1.1.5 and that  $I$  is an ideal of  $R$  such that  $R[I]$  is principal. The multiplication by a generator  $\pi$  induces an injection  $T/I \hookrightarrow T$ , which itself induces an isomorphism

$$H_{\mathcal{F}}^1(K, T/I) \hookrightarrow H_{\mathcal{F}}^1(K, T)[I]$$

*Proof.* Multiplication by  $\pi$  induces an isomorphism  $T/I \cong T[I]$ . Therefore, Proposition 1.2.10 implies that

$$H_{\mathcal{F}}^1(K, T/I) \cong H_{\mathcal{F}}^1(K, T[I]) \cong H_{\mathcal{F}}^1(K, T)[I]$$

□

The theory of Kolyvagin systems is dependent on the core rank, which is an invariant associated to the Selmer structure, that measures the difference in dimension between the Selmer module and the Selmer module of the dual structure.

**Definition 1.2.14.** (Core rank) Let  $\mathcal{F}$  be a Selmer structure on  $T$ . The *core rank* of  $\mathcal{F}$  is the integer

$$\chi(\mathcal{F}) := \dim_k H_{\mathcal{F}}^1(K, T \otimes k) - \dim_k H_{\mathcal{F}}^1(K, T^*[\mathfrak{m}])$$

**Remark 1.2.15.** We will assume  $\chi(\mathcal{F})$  is non-negative. Otherwise, one could swap the roles of  $F^*$  and  $T^*$  since  $\chi(\mathcal{F}^*) = -\chi(\mathcal{F})$ .

When the Selmer structure is cartesian, the core rank can determine the relation of the full Selmer group with the one of the dual Selmer structure.

**Proposition 1.2.16.** ([MR04, Theorem 4.1.5.]) Let  $R$  be a principal, artinian, local ring and let  $\mathcal{F}$  be a cartesian Selmer structure of core rank  $\chi(\mathcal{F}) \geq 0$ . Then there is a non-canonical homomorphism

$$H_{\mathcal{F}}^1(K, T) = R^{\chi(\mathcal{F})} \oplus H_{\mathcal{F}}^1(K, T^*)$$

The argument to compute the structure of a Selmer group involve modifying the local conditions suitably at certain primes. In order to do that, we will set the following definition.

**Definition 1.2.17.** Let  $\mathcal{F}$  be a Selmer structure and let  $a, b$  and  $c$  be pairwise coprime square-free integers. Assume  $c \in \mathcal{N}$ . Define the Selmer structure  $\mathcal{F}_a^b(c)$  by the local conditions

$$H_{\mathcal{F}_a^b(c)}^1(\mathbb{Q}, T) = \begin{cases} H^1(\mathbb{Q}_\ell, T) & \text{if } \ell|a \\ 0 & \text{if } \ell|b \\ H_{\text{tr}}^1(\mathbb{Q}_\ell, T) & \text{if } \ell|c \\ H_{\mathcal{F}}^1(\mathbb{Q}_\ell, T) & \text{otherwise} \end{cases}$$

By Proposition 1.1.17, we can determine explicitly the dual of the modified Selmer structures.

**Proposition 1.2.18.** Let  $\mathcal{F}$  be a cartesian Selmer structure and let  $a, b, c \in \mathcal{N}$  be pairwise coprime. Then

$$(\mathcal{F}_a^b(c))^* = (\mathcal{F}^*)_b^a(c)$$

We can relate the core rank of  $\mathcal{F}_a^b(c)$  with the core rank of  $\mathcal{F}$  and the number of prime divisors of  $a$  and  $b$ .

**Notation 1.2.19.** For every  $n \in \mathcal{N}$ , we denote by  $\nu(n)$  to the number of prime divisors of  $n$ .

**Proposition 1.2.20.** ([Sak18, Corollary 3.21]) Let  $\mathcal{F}$  be a cartesian Selmer structure and let  $a, b, c \in \mathcal{N}$  be pairwise coprime. Then  $\mathcal{F}_a^b(c)$  is also cartesian and

$$\chi(\mathcal{F}_a^b(c)) = \chi(\mathcal{F}) + \nu(b) - \nu(a)$$

The Kolyvagin system argument involve the modification of certain conditions in order to make the Selmer module smaller. For this reason, we will finish this section with some technical lemmas that will be used repeatedly. We start with an application of Chebotarev density theorem that proves the existence of Kolyvagin primes such that their localisation does not annihilate certain elements in the local cohomology group.

**Proposition 1.2.21.** ([BSS18, Lemma 3.9]) Consider non-zero cohomology classes

$$c_1, \dots, c_s \in H^1(K, T), \quad c_1^*, \dots, c_t^* \in H^1(K, T^*)$$

If  $s + t < p$ , there is a Kolyvagin prime  $\ell \in \mathcal{P}$  such that  $\text{loc}_\ell(c_i)$  and  $\text{loc}_\ell(c_i^*)$  are all non-zero.

**Lemma 1.2.22.** ([MR04, Lemma 4.1.7]) Let  $\mathcal{F}$  be a Selmer structure and let  $\ell \notin \Sigma_{\mathcal{F}}$  be a prime satisfying that

$$\text{loc}_\ell : H_{\mathcal{F}}^1(K, T) \rightarrow H_{\mathfrak{f}}^1(K_\ell, T)$$

is surjective. Then  $H_{\mathcal{F}(\ell)}^1(K, T^*) = H_{\mathcal{F}_\ell}^1(K, T^*)$ .

*Proof.* The surjectivity of  $\text{loc}_\ell$ , together with the exact sequence of Proposition 1.2.5 with Selmer structures  $\mathcal{F}_\ell$  and  $\mathcal{F}$  implies that

$$H_{(\mathcal{F}^*)_\ell}^1(K, T^*) = H_{\mathcal{F}^*}^1(K, T^*) \tag{1.2}$$

By construction, we obtain

$$H_{(\mathcal{F}^*)_\ell}^1(K, T^*) = H_{\mathcal{F}^*}^1(K, T^*) \cap H_{(\mathcal{F}^*)_\ell}^1(K, T^*)$$

By equation (1.2)

$$H_{(\mathcal{F}^*)_\ell}^1(K, T^*) = H_{(\mathcal{F}^*)_\ell}^1(K, T^*) \cap H_{(\mathcal{F}^*)_\ell}^1(K, T^*)$$

Since  $H_{(\mathcal{F}^*)_\ell}^1(K, T^*) \subset H_{(\mathcal{F}^*)_\ell}^1(K, T^*)$ , we get that

$$H_{(\mathcal{F}^*)_\ell}^1(K, T^*) = H_{(\mathcal{F}^*)_\ell}^1(K, T^*)$$

□

For the rest of this section, we assume  $R$  is a principal ring. The next two lemmas show how we can make the Selmer group smaller by swapping the local condition at certain appropriate prime  $\ell$ . The situation when  $\chi(\mathcal{F}) \geq 1$  was done in [MR04].

**Lemma 1.2.23.** (see [MR04, Proposition 4.5.8]) Assume  $R$  is principal and let  $\mathcal{F}$  be a cartesian Selmer structure. Assume that  $H_{\mathcal{F}}^1(K, T)$  contains a submodule isomorphic to  $R$  and that

$$H_{\mathcal{F}}^1(K, T^*) \approx R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

for some exponents  $e_1 \geq e_2 \geq \cdots \geq e_s$ . Then there exists a Kolyvagin prime  $\ell \in \mathcal{P}$  such that

$$H_{\mathcal{F}^*(\ell)}^1(K, T^*) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

**Remark 1.2.24.** When  $\chi(\mathcal{F}) \geq 1$ , the Selmer group  $H_{\mathcal{F}}^1(K, T)$  always contains a submodule isomorphic to  $R$ , since there is a non-canonical isomorphisms

$$H_{\mathcal{F}}^1(K, T) \approx R^{\chi(\mathcal{F})} \oplus H_{\mathcal{F}^*}^1(K, T^*)$$

*Proof of Lemma 1.2.23.* Recall that  $k = \text{length}(R)$  and let  $\pi$  be a generator of  $\mathfrak{m}$ . Choose classes  $c \in H_{\mathcal{F}}^1(K, T)$  and  $c^* \in H_{\mathcal{F}^*}^1(K, T^*)$  such that  $\pi^{k-1}c \neq 0$  and  $\pi^{e_1-1}c^* \neq 0$ . By Proposition 1.2.21, there is a Kolyvagin prime  $\ell \in \mathcal{P}$  such that

$$\text{loc}_{\ell}(\pi^{k-1}c) \neq 0, \quad \text{loc}_{\ell}(\pi^{e_1-1}c^*) \neq 0$$

The first condition implies that  $\text{loc}_{\ell}$  is surjective, so Lemma 1.2.23 implies that

$$H_{(\mathcal{F}^*)(\ell)}^1(K, T^*) = H_{(\mathcal{F}^*)_{\ell}}^1(K, T^*) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s} \quad \square$$

When  $\chi(\mathcal{F}) = 0$ , we need to study quotients of  $T$  in order to apply 1.2.22 and, when recovering the information about the Selmer group of  $T$ , we only get partial information. The next lemma is the technical base for the main Theorems [cite](#) about the structure of Selmer group of core rank zero.

**Lemma 1.2.25.** Assume  $R$  is principal and let  $\mathcal{F}$  be a cartesian Selmer structure such that  $\chi(\mathcal{F}) = 0$ . Assume that

$$H_{\mathcal{F}}^1(K, T) \approx R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

for some exponents  $e_1 \geq e_2 \geq \cdots \geq e_s$ . Then there exists a Kolyvagin prime  $\ell \in \mathcal{P}$  and an integer  $t$ , such that  $e_2 \leq t \leq k$ .

$$H_{\mathcal{F}}^1(K, T) \approx R/\mathfrak{m}^t \times R/\mathfrak{m}^{e_3} \cdots \times R/\mathfrak{m}^{e_s}$$

If, moreover,  $e_1 > e_2$ , the integer  $t$  can be chosen equal to  $e_2$ .

*Proof.* Since  $\chi(\mathcal{F}) = 0$ , Proposition 1.2.16 implies that

$$H_{\mathcal{F}^*}^1(K, T^*) \approx H_{\mathcal{F}}^1(K, T) \approx R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

We pick classes  $c \in H_{\mathcal{F}}^1(K, T)$  and  $c^* \in H_{\mathcal{F}^*}^1(K, T^*)$  such that  $\pi^{e_1}c \neq 0$  and  $\pi^{e_1}c^* \neq 0$ . By Proposition 1.2.21, we can choose a Kolyvagin prime  $\ell \in \mathcal{P}$  such that

$$\text{loc}_{\ell}(\pi^{e_1-1}c) \neq 0, \quad \text{loc}_{\ell}(\pi^{e_1-1}c^*) \neq 0$$

Consider the diagram

$$\begin{array}{ccc} H_{\mathcal{F}}^1(K, T/\mathfrak{m}^{e_1}) & \xrightarrow{\text{loc}_{\ell}} & H_{\mathfrak{f}}^1(K_{\ell}, T/\mathfrak{m}^{e_1}) \\ \downarrow \pi^{k-e_1} & & \downarrow \pi^{k-e_1} \\ H_{\mathcal{F}}^1(K, T) & \xrightarrow{\text{loc}_{\ell}} & H_{\mathfrak{f}}^1(K_{\ell}, T/\mathfrak{m}^{e_1}) \end{array}$$

By Proposition 1.2.13, the leftmost vertical map is surjective, so there is some  $c' \in H_{\mathcal{F}}^1(K, T/\mathfrak{m}^{e_1})$  such that  $\text{loc}_{\ell}(\pi^{e_1}c') \neq 0$ .

Note that the element  $\tau \in G_K$  from (T2) in Assumption 1.1.5 satisfies that

$$T/(\mathfrak{m}^{e_1}, \tau - 1) \cong R/\mathfrak{m}^{e_1}$$

and, since  $K(T/\mathfrak{m}^{e_1})_{e_1} \subset K(T)_K$ , then  $\text{Frob}_{\ell}$  is conjugate to  $\tau$  in  $\text{Gal}(K(T/\mathfrak{m}^{e_1})_{e_1}/K)$ , so it is a Kolyvagin prime for  $T/\mathfrak{m}^{e_1}$ . Then we can apply Lemma 1.2.22 to guarantee that

$$H_{(\mathcal{F}^*)_{(\ell)}}^1(K, T^*[\mathfrak{m}^{e_1}]) = H_{(\mathcal{F}^*)_{\ell}}^1(K, T^*[\mathfrak{m}^{e_1}]) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

By Propositions 1.2.16 and 1.2.10,

$$H_{\mathcal{F}(\ell)}^1(K, T)[\mathfrak{m}^{e_1}] \cong H_{\mathcal{F}^*(\ell)}^1(\mathbb{Q}, T^*)[\mathfrak{m}^{e_1}] \cong H_{\mathcal{F}^*(\ell)}^1(\mathbb{Q}, T^*[\mathfrak{m}^{e_1}]) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

Since  $\chi(\mathcal{F}^{\ell}) = 1$  by Proposition 1.2.20, then Proposition 1.2.16 implies that

$$H_{\mathcal{F}(\ell)}^1(\mathbb{Q}, T) \subset H_{\mathcal{F}^{\ell}}^1(\mathbb{Q}, T) \approx R \oplus H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)$$

Therefore,  $H_{\mathcal{F}(\ell)}^1(\mathbb{Q}, T)$  can be injected into  $R \times R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$  and its  $\mathfrak{m}^{e_1}$ -torsion is isomorphic to  $R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$ . Under those considerations, the lemma follows by the structure theorem of  $R/\mathfrak{m}^k$ -modules.  $\square$

Even in the case  $\chi(\mathcal{F}) = 0$ , we can improve Lemma 1.2.25 to obtain a result of the kind of Lemma 1.2.23 even when the Selmer group does not contain submodules isomorphic to  $R$ , but assuming some hypothesis about  $T$  not being residually self-dual.

**Assumption 1.2.26.** Consider the following assumptions to rule out self-duality in  $T$

- (N1)  $T/\mathfrak{m}T$  is not isomorphic to  $T^*[\mathfrak{m}]$  as  $k[[G_K]]$ -modules.
- (N2) The image of the homomorphism  $R \rightarrow \text{End}(T)$  is contained in the image of  $\mathbb{Z}_p[[G_{\mathbb{Q}}]] \rightarrow \text{End}(T)$ .

Under those assumptions, we have a stronger application of the Chebotarev density theorem

**Proposition 1.2.27.** ([MR04, proposition 3.6.2]) Assume that  $T$  satisfies Assumptions 1.1.5 and 1.2.26. Let  $C \subset H^1(K, T)$  and  $D \subset H^1(K, T^*)$  be finite submodules and choose homomorphisms

$$\phi : C \rightarrow R, \quad \psi : D \rightarrow R$$

There exists a set  $S \subset \mathcal{P}$  of positive density such that for all  $\ell \in S$

$$\begin{aligned} C \cap \ker [\text{loc}_\ell : H^1(K, T) \rightarrow H^1(K_\ell, T)] &= \ker(\phi) \\ D \cap \ker [\text{loc}_\ell : H^1(K, T^*) \rightarrow H^1(K_\ell, T^*)] &= \ker(\psi) \end{aligned}$$

**Lemma 1.2.28.** Let  $\mathcal{F}$  be a cartesian Selmer structure satisfying Assumptions 1.1.5 and 1.2.26. Assume that

$$H_{\mathcal{F}}^1(\mathbb{Q}, T) \approx R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

for some  $e_1 \geq \dots \geq e_s \in \mathbb{N}$ . Then there are infinitely many primes  $\ell \in \mathcal{P}_k$  such that

$$H_{\mathcal{F}(\ell)}^1(\mathbb{Q}, T) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

*Proof.* When  $e_1 = \text{length}(R)$ , the result follows from Lemma 1.2.23. Hence we can assume without loss of generality that  $e_1 < \text{length}(R)$ .

Similarly to the proof of Lemma 1.2.25, we can use Proposition 1.2.21 to find an auxiliary prime  $q \in \mathcal{P}$  such that the localisation maps

$$\text{loc}_q : H_{\mathcal{F}}^1(K, T) \rightarrow H_{\mathfrak{f}}^1(K_q, T)[\mathfrak{m}^{e_1}], \quad \text{loc}_q : H_{\mathcal{F}^*}^1(K, T^*) \rightarrow H_{\mathfrak{f}}^1(K_q, T^*)[\mathfrak{m}^{e_1}]$$

are surjective. Hence

$$H_{(\mathcal{F}^*)_q}^1(\mathbb{Q}, T^*) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

Since  $\chi(\mathcal{F}^q) = 1$  by Proposition 1.2.20, Proposition 1.2.16 implies that

$$H_{\mathcal{F}^q}^1(\mathbb{Q}, T) \approx R \times R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s} \quad (1.3)$$

By Proposition ??, we can find infinitely many primes  $\ell$  satisfying the following:

- The kernel of the localisations  $\text{loc}_\ell$  and  $\text{loc}_b$  defined on  $H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)$  are the same. Following Remark 1.1.12, we can define non-canonical isomorphisms

$$H_{\mathfrak{f}}^1(K_q, T^*) \cong H_{\mathfrak{f}}^1(K_\ell, T^*) \cong T^*/(\tau - 1) \cong R \quad (1.4)$$

Under this isomorphism, we can understand  $\text{loc}_q$  and  $\text{loc}_\ell$  as elements in the dual space  $H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)^+$ . In this setting, the above condition implies that there exists a unit  $u \in R^\times$  such that  $\text{loc}_\ell = u \text{loc}_q$ .

- The kernel of the finite localisation map

$$\text{loc}_\ell : H_{\mathcal{F}}^1(K, T) \rightarrow H_{\mathfrak{f}}^1(K_\ell, T)$$

coincides with  $H_{\mathcal{F}_q}^1(K, T)$ . It implies that

$$H_{\mathcal{F}_{q\ell}}^1(K, T) = H_{\mathcal{F}_q}^1(K, T) \approx R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

Since  $\chi(\mathcal{F}^{q\ell}) = 2$  by Proposition 1.2.20, then Proposition 1.2.16 gives an isomorphism

$$H_{\mathcal{F}^{q\ell}}^1(K, T) \approx R^2 \times R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

By proposition 1.2.5, we can consider the following exact sequence

$$H_{\mathcal{F}^{q\ell}}^1(K, T) \longrightarrow H_s^1(K_q, T) \oplus H_s^1(K_\ell, T) \longrightarrow H_{\mathcal{F}^*}^1(K, T^*)^\vee$$

Dualising the isomorphisms in (1.4), we obtain an isomorphism

$$H_s^1(K_q, T) \oplus H_s^1(K_\ell, T) \cong R^2 \quad (1.5)$$

such that the element  $(1, -u^{-1})$  belongs to the kernel of the second map. Therefore, there is an element  $z \in H_{\mathcal{F}^{qb}}^1(\mathbb{Q}, T)$  such that  $\text{loc}_q(z) = 1$  and  $\text{loc}_\ell(z) = -u^{-1}$ , under the identifications in (1.5)

It implies that the relaxed Selmer groups splits as follows.

$$H_{\mathcal{F}^{q\ell}}^1(K, T) = Rz \oplus H_{\mathcal{F}^q}^1(K, T) = Rz \oplus H_{\mathcal{F}^\ell}^1(K, T) \quad (1.6)$$

We want to show now that

$$\Pi_\ell \circ \text{loc}_\ell : H_{\mathcal{F}^\ell}^1(K, T) \rightarrow H_f^1(K_\ell, T)$$

where  $\Pi_\ell : H^1(K_\ell, T) \rightarrow H_f^1(K_\ell, T)$  is the projection of Proposition 1.1.11, is also surjective.

Indeed, let  $x \in H_{\mathcal{F}^\ell}^1(K, T)$  be such that  $\pi^{k-1}x \neq 0$ , where  $\pi$  is a generator of  $\mathfrak{m}$ . By (1.6), there is a unique decomposition  $x = \alpha z + \beta$ , where  $\alpha \in R$  and  $\beta \in H_{\mathcal{F}^q}^1(K, T)$ . Since

$$H_{\mathcal{F}^\ell}^1(\mathbb{Q}, T) \cong R \times R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

then  $\pi^{k-e_1}x \in H_{\mathcal{F}^\ell}^1(K, T) \subset H_{\mathcal{F}^q}^1(\mathbb{Q}, T)$  so  $\alpha \in \mathfrak{m}^{e_1}$ . Then  $\pi^{k-1}\beta \neq 0$ . By the assumptions on the prime  $\ell$ ,

$$\text{loc}_\ell(H_{\mathcal{F}^q}^1(K, T)) = H_f^1(K_\ell, T)$$

the isomorphism in (1.3) implies that  $\text{loc}_\ell(\beta)$  generates  $H_f^1(\mathbb{Q}_\ell, T)$ . Indeed, every element of  $H_{\mathcal{F}^q}^1(K, T)$  is a linear combination of  $\beta$  and elements of  $\mathfrak{m}^{e_2}$ -torsion, so  $\text{loc}_\ell$  would only be surjective when  $\text{loc}_\beta$  generates the whole  $H_f^1(K_\ell, T)$ .

We have that

$$(\Pi_\ell \circ \text{loc}_\ell)(x) - (\Pi_\ell \circ \text{loc}_\ell)(\beta) = \alpha(\Pi_\ell \circ \text{loc}_\ell)(z) \in \mathfrak{m}^{e_1} H_f^1(K_\ell, T)$$

Then  $(\Pi_\ell \circ \text{loc}_\ell)(x)$  also generates  $H_f^1(K_\ell, T)$  and thus

$$\Pi_\ell \circ \text{loc}_\ell : H_{\mathcal{F}^\ell}^1(\mathbb{Q}, T/\mathfrak{m}^k) \rightarrow H_f^1(K_\ell, T)$$

is also surjective. Then the structure theorem over principal ideal domains implies

$$H_{\mathcal{F}^\ell}^1(\mathbb{Q}, T/\mathfrak{m}^k) = \ker \left( \Pi_\ell \circ \text{loc}_\ell : H_{\mathcal{F}^\ell}^1(\mathbb{Q}, T/\mathfrak{m}^k) \rightarrow H_f^1(\mathbb{Q}_\ell, T/\mathfrak{m}^k) \right) \cong R/\mathfrak{m}^{e_2} \times \cdots \times R/\mathfrak{m}^{e_s}$$

□

## Chapter 2

# Kolyvagin systems

### 2.1 Kolyvagin systems and theta ideals

In this section, we outline the classical theory of Kolyvagin systems, as described in [MR04]. This theory is limited to principal coefficient rings  $R$  and core rank being equal to one.

**Assumption 2.1.1.** Assume, in addition to Assumption 1.1.2 that  $R$  is a principal ring, with  $\pi$  denoting a generator of the maximal ideal. Moreover, consider a cartesian Selmer structure of core rank  $\chi(\mathcal{F}) = 1$ .

**Notation 2.1.2.** In order to simplify the notation, we fix a generator  $\tau_\ell$  of  $\mathcal{G}_\ell = \text{Gal}(K(\ell)/K)$  for every Kolyvagin prime  $\ell \in \mathcal{P}$ . This choice fixes, by Proposition 1.1.15, an isomorphism

$$\varphi_\ell^{\text{fs}} : H_{\text{f}}^1(K_\ell, T) \rightarrow H_{\text{s}}^1(K_\ell, T)$$

**Definition 2.1.3.** A *Kolyvagin system* for a Selmer structure  $\mathcal{F}$

$$\kappa = \left\{ \kappa_n \in H_{\mathcal{F}(n)}^1(K, T) : n \in \mathcal{N} \right\}$$

satisfying the following relation for every  $n \in \mathcal{N}$  and  $\ell \in \mathcal{P}$  not dividing  $n$ . By the definition of Selmer module, we have that

$$\text{loc}_\ell(\kappa_n) \in H_{\mathcal{F}(n)}^1(K_\ell, T) = H_{\text{f}}^1(K_\ell, T), \quad \text{loc}_\ell(\kappa_{n\ell}) \in H_{\mathcal{F}(n\ell)}^1(K_\ell, T) = H_{\text{tr}}^1(K_\ell, T)$$

The collection  $\kappa$  is a Kolyvagin system if the following is satisfied

$$\text{loc}_\ell(\kappa_{n\ell}) = \phi_\ell^{\text{fs}} \circ \text{loc}_\ell(\kappa_n) \tag{2.1}$$

for every  $n \in \mathcal{N}$  and  $\ell \in \mathcal{P}$  not dividing  $n$ .

**Remark 2.1.4.** The set of Kolyvagin systems has a natural structure of  $R$ -module. It will be denoted by  $\text{KS}(\mathcal{F})$ .

Kolyvagin systems carry information about the structure of the Selmer group. The key idea is to look at the classes  $\kappa_n$ , where  $n \in \mathcal{N}_i$  for the different non-negative integers  $i$ . The information carried by a single class  $\kappa_n$  is seen in its index.

**Definition 2.1.5.** Let  $M$  be an  $R$ -module and let  $a \in M$ . Consider the canonical map into the bidual module

$$\Phi : M \rightarrow M^{++} : a \in M \mapsto [\varphi \in \text{Hom}(M, R) \mapsto \varphi(a)]$$

The *index* of  $a$  is defined as

$$\text{ind}(a, M) = \text{Im}(\Phi(a))$$

**Remark 2.1.6.** When  $R$  is a principal, local, artinian ring with maximal ideal  $\mathfrak{m}$ , the index of an element  $a \in M$  coincides

$$\text{ind}(a) = \mathfrak{m}^{\max\{j \in \mathbb{N} : a \in \mathfrak{m}^j M\}}$$

**Notation 2.1.7.** When there is no risk of confusion, we will denote  $\text{ind}(a)$  instead of  $\text{ind}(a, M)$ .

We can now define the ideals  $\Theta_i$  as the ideals in  $R$  generated by the indices of all  $\kappa_n$  where  $n \in \mathcal{N}_i$ .

**Definition 2.1.8.** Let  $\kappa \in \text{KS}(\mathcal{F})$ . The theta ideals of  $\kappa$  are defined as

$$\Theta_i(\kappa) := \sum_{n \in \mathcal{N}_i} \text{ind}\left(\kappa_n, H_{\mathcal{F}(n)}^1(K, T)\right)$$

**Theorem 2.1.9.** ([MR04, Theorem 4.3.3]) Under Assumption 2.1.1,  $\text{KS}(\mathcal{F})$  is a free, cyclic  $R$ -module.

## 2.2 Selmer structures of core rank 1

The generators of  $\text{KS}(\mathcal{F})$  are the Kolyvagin systems carrying information about the Selmer group.

**Definition 2.2.1.** A Kolyvagin system is said to be *primitive* if it generates  $\text{KS}(\mathcal{F})$  as an  $R$ -module.

We can now state the main theorem of loc. cit., which relates the theta ideals of a primitive Kolyvagin systems with the (higher) Fitting ideals of the Selmer group.

**Theorem 2.2.2.** ([MR04, Theorem 4.5.9]) Let  $R$  be a principal, artinian, local ring with finite residue field, and let  $T$  be an  $R[[G_K]]$ -module, which is free and finitely generated as  $R$ -module and unramified only at finitely many places. Let  $\mathcal{F}$  be a cartesian Selmer structure on  $T$  of core rank  $\chi(\mathcal{F}) = 1$ . If  $\kappa \in \text{KS}(\mathcal{F})$  is a primitive Kolyvagin system, then

$$\Theta_i(\kappa) = \text{Fitt}_i^R(H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*))$$

The proof of Theorem 2.2.2 is divided in the following two lemmas:

**Lemma 2.2.3.** ([MR04, Corollary 4.5.4.]) Under Assumption 2.1.1, if  $\kappa \in \text{KS}(T)$  is a Kolyvagin system and  $n \in \mathcal{N}$ , then

$$\text{ind}(\kappa_n) = \text{Fitt}^0(H_{\mathcal{F}^*(n)}^1(K, T^*))$$

**Lemma 2.2.4.** Under Assumption 2.1.1, then

$$\text{Fitt}_i^R(H_{\mathcal{F}^*}^1(K, T^*)) = \sum_{n \in \mathcal{N}_i} \text{Fitt}^0(H_{(\mathcal{F}^*)(n)}^1(K, T^*))$$

### 2.2.1 Proof of Lemma 2.2.4

In order to prove Lemma 2.2.4, we start by showing, for any  $n \in \mathcal{N}_i$ , the inclusion

$$\text{Fitt}_0^R(H_{\mathcal{F}^*(n)}^1(K, T^*)) \subset \text{Fitt}_i^R(H_{\mathcal{F}^*}^1(K, T^*))$$

Consider the exact sequence

$$0 \longrightarrow H_{\mathcal{F}_n^*}^1(K, T) \longrightarrow H_{\mathcal{F}^*}^1(K, T) \longrightarrow \prod_{\ell|n} H_{\mathcal{F}^*}^1(K, T)$$

Since all the prime divisors of  $n$  are Kolyvagin primes, the last term is isomorphic to  $R^{\nu(n)}$ . The description of Fitting ideals over principal rings in Proposition A.1.4 implies that

$$\text{Fitt}_0^R(H_{\mathcal{F}_n^*}^1(K, T)) \subset \text{Fitt}_{\nu(n)}^R(H_{\mathcal{F}^*}^1(K, T))$$

Since  $H_{\mathcal{F}_n^*}^1(K, T) \subset H_{\mathcal{F}^*(n)}^1(K, T)$ , then

$$\text{Fitt}_0^R(H_{\mathcal{F}^*(n)}^1(K, T)) \subset \text{Fitt}_0^R(H_{\mathcal{F}_n^*}^1(K, T))$$

Combining both inclusions, we conclude the proof of this inclusion.

In order to deal with the other inclusion, we need to construct, for each  $i \in \mathbb{Z}_{\geq 0}$ , a vertex  $n_i \in \mathcal{N}_i$  such that

$$\text{Fitt}^0(H_{(\mathcal{F}^*)(n_i)}^1(K, T^*)) = \text{Fitt}_i^R(H_{\mathcal{F}^*}^1(K, T^*))$$

Assume we have a structural homomorphism

$$H_{\mathcal{F}}^1(K, T^*) \approx R^r \times R/\mathfrak{m}^{e_1} \times \cdots R/\mathfrak{m}^{e_s}$$

An inductive application of Lemma 1.2.23 (see also Remark 1.2.24) construct vertices  $n_i \in \mathcal{N}_i$  such that

$$\begin{aligned} H_{\mathcal{F}(n_i)}^1(K, T) &\cong R^{r-i} \times R/\mathfrak{m}^{e_1} \times \cdots R/\mathfrak{m}^{e_s} \text{ for } i \leq r \\ H_{\mathcal{F}(n_{r+j})}^1(K, T) &\cong R/\mathfrak{m}^{e_{j+1}} \times \cdots R/\mathfrak{m}^{e_s} \text{ for } j \geq 1 \end{aligned}$$

This proves the other inclusion, what concludes the proof of this lemma.

### 2.3 Selmer structures of rank 0

When  $\mathcal{F}$  is a cartesian Selmer structure of core rank 0, we cannot apply the argument above since the only Kolyvagin system is the trivial one.

**Theorem 2.3.1.** ([MR04, Theorem 4.2.2]) Let  $\mathcal{F}$  be a cartesian Selmer structure such that  $\chi(\mathcal{F}) = 0$ . Then  $\text{KS}(\mathcal{F}) = 0$ .

The method we will use for the computation of the Selmer module  $H_{\mathcal{F}}^1(K, T)$  involves considering an auxiliary Selmer structure  $\mathcal{G} \geq \mathcal{F}$ , also cartesian, such that  $\chi(\mathcal{G}) = 1$ . One can show that  $\mathcal{F}$  and  $\mathcal{G}$  only differ in one local condition.

**Proposition 2.3.2.** There exists a unique prime  $\ell$  such that  $H_{\mathcal{F}}^1(K_q, T) \subsetneq H_{\mathcal{G}}^1(K_q, T)$ . Moreover, there is a non-canonical homomorphism

$$H_{\mathcal{G}/\mathcal{F}}^1(K_q, T) := H_{\mathcal{G}}^1(K_q, T) / H_{\mathcal{F}}^1(K_q, T) \approx R$$

*Proof.* By Proposition 1.2.5, there is an global-duality exact sequence for  $\bar{T} := T \otimes k$

$$H_{\mathcal{F}}^1(K, \bar{T}) \rightarrow H_{\mathcal{G}}^1(K, \bar{T}) \rightarrow \bigoplus_{q \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}} \frac{H_{\mathcal{G}}^1(K_q, \bar{T})}{H_{\mathcal{F}}^1(K_q, \bar{T})} \rightarrow H_{\mathcal{G}}^1(K, \bar{T}^*)^{\vee} \twoheadrightarrow H_{\mathcal{F}}^1(K, \bar{T}^*)^{\vee}$$

Since  $\chi(\mathcal{F}) = 0$  and  $\chi(\mathcal{G}) = 1$ , Definition 1.2.14 and dimension counting implies that

$$\dim_k \left( \bigoplus_{q \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}} \frac{H_{\mathcal{G}}^1(K_q, \bar{T})}{H_{\mathcal{F}}^1(K_q, \bar{T})} \right) = 1$$

Therefore, there exists a unique prime  $\ell$  such that  $H_{\mathcal{F}}^1(K_{\ell}, \bar{T}) \subsetneq H_{\mathcal{G}}^1(K_{\ell}, \bar{T})$ . Hence  $H_{\mathcal{F}}^1(K_{\ell}, T) \subsetneq H_{\mathcal{G}}^1(K_{\ell}, T)$ .

For all other primes  $q \neq \ell$ , we can apply [MR04, Lemma 1.1.5], which says that for every pair of cartesian Selmer structures  $\mathcal{F}$  and  $\mathcal{G}$ , the quantity

$$\text{length}(H_{\mathcal{G}}^1(K_q, T \otimes R/\mathfrak{m}^i)) - \text{length}(H_{\mathcal{F}}^1(K_q, T \otimes R/\mathfrak{m}^i)) \quad (2.2)$$

is linearly dependent on  $i$ . Since it vanishes for  $i = 1$ , then  $H_{\mathcal{F}}^1(K_q, T) = H_{\mathcal{G}}^1(K_q, T)$ .

For the prime  $\ell$ , [MR04, Lemma 1.1.5] implies that

$$\text{length}(H_{\mathcal{G}/\mathcal{F}}^1(K_{\ell}, T)) = \text{length}(R) \quad (2.3)$$

Consider the following composition, which coincides with the multiplication by  $\pi^{k-1}$ .

$$H_{\mathcal{G}/\mathcal{F}}^1(K_{\ell}, T) \rightarrow H_{\mathcal{G}/\mathcal{F}}^1(K_{\ell}, T \otimes k) \xrightarrow{\pi^{k-1}} H_{\mathcal{G}/\mathcal{F}}^1(K_{\ell}, T)$$

The first map is surjective by the propagation of Selmer structures and the second one is injective since  $\mathcal{F}$  is cartesian. By the induction hypothesis,  $H_{\mathcal{G}/\mathcal{F}}^1(K_{\ell}, T)$  is an  $R$  of length  $k$  whose  $\mathfrak{m}^{k-1}$ -torsion induces a non-trivial quotient. Hence, the structure theorem implies that

$$H_{\mathcal{G}/\mathcal{F}}^1(K_{\ell}, T) \cong R \quad \square$$

**Remark 2.3.3.** If we choose a Kolyvagin prime, or any other prime  $\ell$  such that  $H_{\mathcal{F}}^1(K_\ell, T) \cong R$ , the Selmer structure  $\mathcal{G} = \mathcal{F}^\ell$  is cartesian with  $\chi(\mathcal{F}^\ell) = 1$ .

Now, we describe a process in which Kolyvagin systems for  $\mathcal{G}$  describe the Selmer module  $H_{\mathcal{F}}^1(K, T)$ . In order to do that, we need to localise the Kolyvagin systems at the prime at which  $\mathcal{F}$  and  $\mathcal{G}$  differ.

**Definition 2.3.4.** Let  $\mathcal{F} \leq \mathcal{G}$  be two Selmer structures with  $\chi(\mathcal{F}) = 0$  and  $\chi(\mathcal{G}) = 1$  differing at the prime  $\ell$  and let  $\kappa \in \text{KS}(\mathcal{G})$ . Define the quantities  $\delta$  associated to  $\kappa$  by

$$\delta_n(\kappa, \mathcal{F}) := \text{loc}_\ell(\kappa_n) \in H_{\mathcal{G}}^1(K_\ell, T) / H_{\mathcal{F}}^1(K_\ell, T) \quad \forall n \in \mathcal{N}$$

The quantities  $\delta_n$  can be used to define the  $\Theta$  ideals of rank 0.

**Definition 2.3.5.** Let  $\mathcal{F} \leq \mathcal{G}$  be two Selmer structures such that  $\chi(\mathcal{F}) = 0$  and  $\chi(\mathcal{G}) = 1$  differing at the prime  $\ell$  and let  $\kappa \in \text{KS}(\mathcal{G})$ . We can define the ideals of  $R$

$$\Theta_i^{(0)}(\kappa, \mathcal{F}) := \sum_{n \in \mathcal{N}_i} \text{ind}(\delta_n(\kappa, \mathcal{F}), H_{\mathcal{G}/\mathcal{F}}^1(K_\ell, T))$$

The comparison between the ideals  $\Theta_i^{(0)}(\kappa, \mathcal{F})$  and the Fitting ideals of  $H_{\mathcal{F}}^1(K, T)$  leads to the first main result of this thesis.

**Theorem 2.3.6.** Let  $R$  be a principal, artinian, local ring with finite residue field, let  $T$  be an  $R[[G_K]]$ -module, unramified only at finitely many places which is free and finitely generated as an  $R$ -module. Assume  $\mathcal{F} \leq \mathcal{G}$  are cartesian Selmer structures on  $T$  satisfying that  $\chi(\mathcal{F}) = 0$  and  $\chi(\mathcal{G}) = 1$ . If  $\kappa \in \text{KS}(\mathcal{G})$  is a primitive Kolyvagin system, then

$$\Theta_i^{(0)}(\kappa, \mathcal{F}) \subset \text{Fitt}_i^R(H_{\mathcal{F}}^1(K, T)) \quad \forall i \in \mathbb{Z}_{\geq 0} \quad (2.4)$$

Moreover, if one of the following conditions is satisfied

- (i)  $i \leq \dim_k(H_{\mathcal{F}}^1(K, T) / H_{\mathcal{F}}^1(K, T)[\mathfrak{m}^{k-1}]) =: r$
- (ii)  $\Theta_{i-1}^{(0)}(\kappa, \mathcal{F}) \subsetneq \text{Fitt}_{i-1}^R(H_{\mathcal{F}}^1(K, T))$
- (iii) There is some  $k \in \mathbb{N}$  and some  $n \in \mathcal{N}$  such that  $\nu(n) = i - 1$ ,  $\Theta_{i-1}(\kappa) = \delta_n R$  and

$$H_{\mathcal{F}(n)}^1(\mathbb{Q}, T) \approx R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

for some  $e_1 > e_2 \geq \cdots \geq e_s$ .

then the equality  $\Theta_i^{(0)}(\kappa, \mathcal{F}) = \text{Fitt}_i^R(H_{\mathcal{F}}^1(\mathbb{Q}, T))$  holds.

Similarly to the results in §2.1, the proof is divided in the following lemmas, which will be proven in the next subsections.

**Lemma 2.3.7.** If  $\kappa \in \text{KS}(\mathcal{G})$  is a primitive Kolyvagin system and  $n \in \mathcal{N}$ , then

$$\text{ind}(\delta_n) = \text{Fitt}_0^R(H_{\mathcal{F}(n)}^1(K, T))$$

**Lemma 2.3.8.** If  $\mathcal{F}$  is a cartesian

$$\sum_{n \in \mathcal{N}_i} \text{Fitt}_0^R(H_{\mathcal{F}^*(n)}^1(K, T^*)) \subset \text{Fitt}_i^R(H_{\mathcal{F}^*}^1(K, T^*))$$

*Proof.* Analogous to the similar inclusion in Lemma 2.2.4.  $\square$

In order to prove the other inclusion, whenever it holds, we will construct a vertex  $n_i \in \mathcal{N}_i$  such that

$$\text{Fitt}_0^R(H_{\mathcal{F}^*(n_i)}^1(K, T^*)) = \text{Fitt}_i^R(H_{\mathcal{F}^*}^1(K, T^*))$$

Note that the equality holds trivially when  $i < r$ , since  $\text{Fitt}_i^R(H_{\mathcal{F}^*}^1(K, T^*))$  vanishes. For  $i = r$ , the equality is proven in the following lemma.

**Lemma 2.3.9.** There exists some vertex  $n_r \in \mathcal{N}_r$  such that

$$\text{Fitt}_0^R(H_{\mathcal{F}^*(n_r)}^1(K, T)) = \text{Fitt}_r^R(H_{\mathcal{F}}^1(K, T))$$

Lemma 2.3.9 completes the proof of the equality  $\Theta_i^{(0)}(\kappa, \mathcal{F}) = \text{Fitt}_i^R(H_{\mathcal{F}}^1(\mathbb{Q}, T))$  under assumption (i).

Note that Lemma 2.3.9 determines the structure of the modified Selmer group. Indeed, assume there is a structural homomorphism

$$H_{\mathcal{F}}^1(K, T) \approx R^r \times R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

for some exponents  $e_1 \geq \cdots \geq e_s$ , all being at most  $k-1$ . Then there is an homomorphism

$$H_{\mathcal{F}(n_r)}^1(K, T) \approx R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

We can extend this construction to higher values of  $i$ .

**Lemma 2.3.10.** For every  $j \geq 0$ , we can either construct a vertex

- $n_{r+j} \in \mathcal{N}_{r+j}$  such that  $H_{\mathcal{F}(n_{r+j})}^1(K, T) \cong R/\mathfrak{m}^{e_{j+1}} \times \cdots \times R/\mathfrak{m}^{e_s}$ .
- $n_{r+j+1} \in \mathcal{N}_{r+j+1}$  such that  $H_{\mathcal{F}(n_{r+j+1})}^1(K, T) \cong R/\mathfrak{m}^{e_{j+1}} \times \cdots \times R/\mathfrak{m}^{e_s}$ .

Note that such vertices guarantee the equality in Theorem 2.3.6 for their respective indices.

**Corollary 2.3.11.** For the indices  $k \geq 0$  such that there exists an element  $n_r \in \mathcal{N}_r$  as in Lemma 2.3.10, there is an equality

$$\sum_{n \in \mathcal{N}_{r+k}} \text{Fitt}_0^R(H_{\mathcal{F}^*(n)}^1(K, T^*)) \subset \text{Fitt}_{r+k}^R(H_{\mathcal{F}^*}^1(K, T^*))$$

Corollary 2.3.11 proves the equality  $\Theta_i^{(0)}(\kappa, \mathcal{F}) = \text{Fitt}_i^R(H_{\mathcal{F}}^1(\mathbb{Q}, T))$  under assumption (i). Indeed, if such equality does not hold for some index  $i - 1 = r + j - 1$ , the vertex  $n_{r+j-1}$  in Lemma 2.3.10 cannot be constructed. Hence, Lemma 2.3.10 guarantees the existence of the vertex  $n_{r+j}$ , which proves the equality for the index  $i = r + j$  by Corollary 2.3.11.

This concludes the proof of Theorem 2.3.6. The inclusion is a direct consequence of Lemmas 2.3.7 and 2.3.8. Lemma 2.3.9 and Corollary 2.3.11 proves the equality under the first or second assumption. If we are in the situation of the third assumption for some index  $i - 1 = r + j - 1$ , the proof of Lemma 2.3.10 shows that we can construct the vertex  $n_{r+j} \in \mathcal{N}_{r+j}$  satisfying that

$$H_{\mathcal{F}(n_{r+j})}^1(K, T) \cong R/\mathfrak{m}^{e_{j+1}} \times \cdots \times R/\mathfrak{m}^{e_s}$$

This construction proves the equality for the index  $i = r + j$ .

Theorem 2.3.6 requires  $\mathcal{G}$  to be a primitive Kolyvagin system. This fact can also be checked from the quantities  $\delta_n$ .

**Theorem 2.3.12.** Let  $R$  be a principal, artinian, local ring with finite residue field, let  $T$  be an  $R[[G_K]]$ -module, unramified only at finitely many places which is free and finitely generated as an  $R$ -module. Assume  $\mathcal{F} \leq \mathcal{G}$  are cartesian Selmer structures on  $T$  satisfying that  $\chi(\mathcal{F}) = 0$  and  $\chi(\mathcal{G}) = 1$ . If  $\kappa \in KS(\mathcal{G})$ , then  $\kappa$  is primitive if and only if there is  $n \in \mathcal{N}$  such that

$$\text{ind}(\delta_n(\kappa, \mathcal{F}), H_{\mathcal{G}/\mathcal{F}}^1(K, T)) = R$$

*Proof.* If  $\kappa$  is not primitive, there is a primitive Kolyvagin systems  $\kappa'$  such that  $\kappa = a\kappa'$  and  $a \in R \setminus R^\times$ . Then

$$\text{ind}(\delta_n(\kappa, \mathcal{F})) = (a) \text{ind}(\delta_n(\kappa', \mathcal{F})) \subset aR$$

Conversely, if  $\kappa$  is primitive, Lemma 2.3.7 reduces the proof to finding some  $n \in \mathcal{N}$  such that

$$H_{\mathcal{F}(n)}^1(K, T) = 0$$

By Proposition 1.2.13, this is equivalent to

$$H_{\mathcal{F}(n)}^1(K, T \otimes k) = 0$$

Such  $n \in \mathbb{N}$  can be obtained by an inductive application of Lemma 1.2.23 on the  $k$  representation  $T \otimes k$ .  $\square$

### 2.3.1 Proof of Lemma 2.3.7

The proof of Lemma 2.3.7 involves comparing the indices of  $\kappa_n$  and  $\delta_n$ , so we can then apply Lemma 2.2.3.

**Lemma 2.3.13.** For every  $n \in \mathcal{N}$ , let

$$C_n := \text{coker} \left( \text{loc}_\ell : H_{\mathcal{G}}^1(K, T) \rightarrow H_{\mathcal{G}/\mathcal{F}}^1(K_\ell, T) \right)$$

Then  $\text{ind}(\delta_n) = \text{ind}(\kappa_n) \cdot \text{Fitt}^{(0)}(C_n)$ .

*Proof.* Note that Proposition 1.2.16 and Proposition 1.2.20 implies the existence of a non-canonical isomorphism

$$H_{\mathcal{G}(n)}^1(K, T) \approx R \oplus H_{\mathcal{G}^*(n)}^1(K, T^*) \quad (2.5)$$

Let  $(x_n, y_n)$  be the components of  $\kappa_n$  under this identification. By Lemma 2.2.3,  $\text{ind}(\kappa_n) = \text{Fitt}_0^R(H_{\mathcal{F}^*}^1(K, T^*))$ , then  $y_n = 0$  and  $x_n$  is a generator of  $\text{ind}(\kappa_n)$ . The decomposition in (2.5) induces a map in  $R^+$  defined by

$$R \longrightarrow H_{\mathcal{G}}^1(K, T) \xrightarrow{\text{loc}_\ell} H_{\mathcal{G}/\mathcal{F}}^1(K_\ell, T) \longrightarrow R$$

The composite map is the multiplication by some  $a \in R$ , which is also a generator of  $\text{Fitt}_0^R(C_n)$ . Therefore,

$$\text{ind}(\delta_n) = \text{ind}(\kappa_n) \text{Fitt}_0^R(C_n)$$

□

*Proof of Lemma 2.3.7.* The exact sequence in Proposition 1.2.5 induces a short exact sequence

$$0 \longrightarrow C_n \longrightarrow H_{\mathcal{F}^*(n)}^1(K, T)^\vee \longrightarrow H_{\mathcal{G}^*(n)}^1(K, T)^\vee \longrightarrow 0$$

We then have the identity of Fitting ideals

$$\text{Fitt}_0^R(H_{\mathcal{F}^*(n)}^1(K, T)) = \text{Fitt}_0^R(C_n) \text{Fitt}_0^R(H_{\mathcal{G}^*(n)}^1(K, T)) = \text{Fitt}_0^R(C_n) \text{ind}(\kappa_n) = \text{ind}(\delta_n)$$

where the second inequality follows from Lemma 2.2.3 and the last one from Lemma 2.3.13. □

### 2.3.2 Proof of Lemma 2.3.9

The proof is obtained as an inductive application of Lemma 1.2.23. By the structure theorem of finitely generated  $R$ -modules, and the definition of core rank, there are non-canonical homomorphisms

$$H_{\mathcal{F}}^1(K, T) = H_{\mathcal{F}^*}^1(K, T^*) = R^r \times R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

We will construct inductively a vertex  $n_i \in \mathcal{N}_i$ , where  $i \leq r$ , such that

$$H_{\mathcal{F}(n_i)}^1(K, T) \approx H_{\mathcal{F}^*(n_i)}^1(K, T^*) \approx R^{r-i} \times R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

Indeed, assume we have constructed  $n_i \in \mathcal{N}_i$  for some  $i \leq r-1$ . Clearly,  $H_{\mathcal{F}(n_i)}^1(K, T)$  contains a submodule isomorphic to  $R$ , so Lemma 1.2.23 implies the existence of a prime  $\ell_{i+1}$  such that for  $n_{i+1} = n_i \ell_{i+1}$ , we get that

$$H_{\mathcal{F}(n_{i+1})}^1(K, T^*) \approx R^{r-(i+1)} \times R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

Since  $\chi(\mathcal{F}) = 0$ , there is a non-canonical homomorphism

$$H_{\mathcal{F}(n_{i+1})}^1(K, T) \approx H_{\mathcal{F}^*(n_{i+1})}^1(K, T^*) \approx R^{r-(i+1)} \times R/\mathfrak{m}^{e_1} \times \cdots \times R/\mathfrak{m}^{e_s}$$

### 2.3.3 Proof of Lemma 2.3.10

Note that the element  $n_r \in \mathcal{N}_r$  was already constructed in Lemma 2.3.9. An inductive application of Lemma 1.2.25, implies the existence of an element  $n_{r+j} \in \mathcal{N}_{r+j}$  such that

$$H_{\mathcal{F}(n_{r+j})}^1(K, T) \approx H_{\mathcal{F}^*(n_{r+j})}^1(K, T^*) \approx R/\mathfrak{m}^{t_{j+1}} \times R/\mathfrak{m}^{e_{j+2}} \times \cdots \times R/\mathfrak{m}^{e_s}$$

where  $t_{j+1} \geq e_{j+1}$ . We assume that we construct this elements minimising the exponents  $t_{j+1}$  in every step.

For an index  $j$ , if  $t_{j+1} = e_{j+1}$ , then the element  $n_{r+j} \in \mathcal{N}_{r+j}$  satisfy the hypothesis of Lemma 2.3.10.

Otherwise, if  $t_{j+1} > e_{j+1}$ , then  $t_{j+1} > e_{j+2}$  as well, so the last remark in Lemma 1.2.25 guarantees the existence of a prime  $\ell_{r+j+1}$  such that, when  $n_{r+j+1} = n_{r+j}\ell_{r+j+1}$ , the exponent  $t_{j+2}$  coincides with  $e_{j+2}$ . By the minimality assumption on  $t_{j+2}$ , we know that

$$H_{\mathcal{F}(n_{r+j+1})}^1(K, T) \approx H_{\mathcal{F}^*(n_{r+j+1})}^1(K, T^*) \approx R/\mathfrak{m}^{e_{j+2}} \times \cdots \times R/\mathfrak{m}^{e_s}$$

## 2.4 Non-self dual Galois representations of rank 0

This section is devoted to the computation of the Fitting ideals of a Selmer module  $H_{\mathcal{F}}^1(K, T)$  of a cartesian Selmer structure of core rank  $\chi(\mathcal{F}) = 0$ , defined over a Galois representation  $T$  satisfying Assumptions 1.2.26.

**Theorem 2.4.1.** Let  $R$  be a principal, artinian, local ring with finite residue field, let  $T$  be an  $R[[G_K]]$ -module unramified only at finitely many places, and let  $\mathcal{F} \leq \mathcal{G}$  be a cartesian Selmer structures on  $T$  satisfying Assumptions 1.2.26 and  $\chi(\mathcal{G}) = 1$ . If  $\kappa \in \text{KS}(\mathcal{G})$  is a primitive Kolyvagin system, then

$$\Theta_i^{(0)}(\kappa, \mathcal{F}) = \text{Fitt}_i^R(H_{\mathcal{F}}^1(K, T))$$

Note that the inclusion

$$\Theta_i^{(0)}(\kappa, \mathcal{F}) \subset \text{Fitt}_i^R(H_{\mathcal{F}}^1(K, T))$$

is proven by theorem 2.3.6. In addition, Lemma 2.3.7 reduce the proof of the other inclusion to the following lemma.

**Lemma 2.4.2.** For every  $i \in \mathbb{Z}_{\geq 0}$ , there exists some vertex  $n_i \in \mathcal{N}_i$  such that

$$\text{Fitt}_0^R(H_{\mathcal{F}^*(n_i)}^1(K, T)) = \text{Fitt}_i^R(H_{\mathcal{F}}^1(K, T))$$

*Proof.* Assume we we have a structural homomorphism

$$H_{\mathcal{F}}^1(K, T^*) \approx R^r \times R/\mathfrak{m}^{e_1} \times \cdots R/\mathfrak{m}^{e_s}$$

An inductive application of Lemma 1.2.28 (see also Remark 1.2.24) construct vertices  $n_i \in \mathcal{N}_i$  such that

$$\begin{aligned} H_{\mathcal{F}(n_i)}^1(K, T) &\cong R^{r-i} \times R/\mathfrak{m}^{e_1} \times \cdots R/\mathfrak{m}^{e_s} \text{ for } i \leq r \\ H_{\mathcal{F}(n_{r+j})}^1(K, T) &\cong R/\mathfrak{m}^{e_{j+1}} \times \cdots R/\mathfrak{m}^{e_s} \text{ for } j \geq 1 \end{aligned}$$

This proves the other inclusion, what concludes the proof of this lemma. □

## 2.5 Selmer groups over discrete valuation rings

this section has not been written yet. These are materials from the paper

**Remark 2.5.1.** Assume either

- $R$  is a discrete valuation ring.
- $\text{length}(R) \geq \text{length}(H_{\mathcal{F}}^1(\mathbb{Q}, T)_{\text{tors}})$ .

Then  $\text{rank}_R(H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)^\vee)$  is the minimal  $i$  such that  $\Theta_i \neq 0$ .

Provided that we know the ideals  $\Theta_i(\kappa)$ , theorem ?? determines the Fitting ideals of the dual Selmer group

**Corollary 2.5.2.** Assume  $R$  is a discrete valuation ring and write  $\Theta_i(\kappa) = \mathfrak{m}^{n_i}$ . Then

$$\text{Fitt}_i^R(H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)^\vee) = \mathfrak{m}^{\min\left\{n_i, \frac{n_{i+1} + n_{i-1}}{2}\right\}}$$

*Proof.* Write  $\text{Fitt}_i^R(H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)^\vee) = \mathfrak{m}^{m_i}$ , so the inequality in theorem ?? implies that  $n_i \geq m_i$ . By the structure theorem of finitely generated modules over principal ideal domains, the following inequality holds for  $i \in \mathbb{N}$ :

$$m_{i+1} - m_i \geq m_i - m_{i-1}$$

Hence the index  $m_i$  can be upper bounded using  $m_{i-1}$  and  $m_{i+1}$ :

$$m_i \leq \frac{m_{i+1} + m_{i-1}}{2} \tag{2.6}$$

Assume that  $n_i = m_i$ . Then

$$m_i \leq \frac{m_{i+1} + m_{i-1}}{2} \leq \frac{n_{i+1} + n_{i-1}}{2} \Rightarrow m_i = \min\left\{n_i, \frac{n_{i+1} + n_{i-1}}{2}\right\}$$

Assume that  $n_i > m_i$ . Theorem ?? can be applied to  $i + 1$ . Since condition (ii) in this theorem holds by our assumption, we obtain that  $m_{i+1} = n_{i+1}$ . On the other hand, assume by contradiction that  $n_{i-1} > m_{i-1}$ . In this case, theorem ??, would imply that  $n_i = m_i$ , contradicting our assumption. Therefore,  $n_{i-1} = m_{i-1}$ . Moreover, condition

(iii) in theorem ?? cannot be satisfied since, otherwise, our assumption would not be true. Hence, the equality holds in equation (2.6) and we obtain

$$m_i = \frac{m_{i+1} + m_{i-1}}{2} = \frac{n_{i+1} + n_{i-1}}{2} = \min \left\{ n_i, \frac{n_{i+1} + n_{i-1}}{2} \right\}$$

□

Under those assumptions, the following improvement of theorem ?? is true. Sakamoto proves the equality (2.7) below under stronger assumptions when the coefficient ring  $R$  is a Gorenstein ring of dimension zero. In particular, R. Sakamoto's result only worked when  $H_{\mathcal{F}}^1(\mathbb{Q}, T) = 0$ . However, when  $R$  is a principal ring, we can weaken the assumptions to obtain the following result.

**Theorem 2.5.3.** Let  $(T, \mathcal{F}, \mathcal{P})$  be a Selmer triple satisfying ??-?? and (N1)-(N2). Then for every  $i \in \mathbb{Z}_{\geq 0}$ , the following equality is satisfied:

$$\Theta_i(\kappa) = \text{Fitt}_i^R (H_{\mathcal{F}^*}^1(\mathbb{Q}, T^*)^\vee) \quad (2.7)$$

## Chapter 3

# Patched Cohomology

### 3.1 Ultrafilters

#### 3.1.1 Definition

**Definition 3.1.1.** A *filter* in the natural numbers is a collection of sets  $\mathcal{U}$  in the power set  $\mathcal{P}(\mathbb{N})$  such that

- (F0) The empty set does not belong to  $\mathcal{U}$ .
- (F1) If  $S_1 \subset S_2$  and  $S_1 \in \mathcal{U}$ , then  $S_2 \in \mathcal{U}$ .
- (F2) If  $S_1, S_2 \in \mathcal{U}$ , then  $S_1 \cap S_2 \in \mathcal{U}$ .

We say that a filter is an *ultrafilter* if it also satisfies the following condition

- (UF) For every set  $S \in \mathcal{P}(\mathbb{N})$ , either  $S \in \mathcal{U}$  or  $\mathbb{N} \setminus S \in \mathcal{U}$ .

The key property of ultrafilters is that (UF) generalises to finite partitions, i.e., ultrafilters contain exactly one set in every finite partition of  $\mathbb{N}$ .

**Proposition 3.1.2.** Let  $\mathcal{U}$  be an ultrafilter and let  $\{P_1, \dots, P_s\}$  be a partition of  $\mathbb{N}$ . Then there exists a unique  $i$  such that  $P_i \in \mathcal{U}$ .

*Proof.* It follows from an inductive application of (UF). □

Last proposition can be reinterpreted in the following form:

**Corollary 3.1.3.** ([Swe22, proposition 2.1.2]) Let  $\mathcal{U}$  be an ultrafilter, let  $S \in \mathcal{U}$  and let  $C$  be a finite set. For every map  $f : S \rightarrow C$ , there exists a unique  $c \in C$  such that  $f^{-1}(c) \in \mathcal{U}$ .

The only ultrafilters we can explicitly describe are those formed by the subsets of the naturals containing one specific element, known as principal ultrafilters.

**Definition 3.1.4.** Let  $a \in \mathbb{N}$ . The collection of sets

$$\mathcal{U}_a = \{S \subset \mathbb{N} : a \in S\}$$

is an ultrafilter. These are known as *principal ultrafilters*.

In fact, principal ultrafilters are the only ones containing finite sets.

**Proposition 3.1.5.** Let  $\mathcal{U}$  be an ultrafilter and assume there is a finite set  $S$  that belongs to  $\mathcal{U}$ . Then there exists an element  $a \in S$  such that  $\mathcal{U} = \mathcal{U}_a$ .

*Proof.* Consider the finite union

$$\mathbb{N} = (\mathbb{N} \setminus S) \cup \bigcup_{a \in S} \{a\}$$

By proposition 3.1.2, one of the above sets belong to  $\mathcal{U}$ . Since  $(\mathbb{N} \setminus S)$  does not, there is some  $a \in S$  such that  $\{a\} \in \mathcal{U}$ . By (F2),  $\mathcal{U}_a \in \mathcal{U}$ .

In order to show the equality, assume there exists  $T \in \mathcal{U} \setminus \mathcal{U}_a$ . Then  $T \cap \{a\} = \emptyset \in \mathcal{U}$ , contradicting (F0). Therefore,  $\mathcal{U} = \mathcal{U}_a$ .  $\square$

However, those ultrafilters which are interesting for our purposes are the non-principal ones. Although they cannot be explicitly constructed, its existence is guaranteed, assuming the axiom of choice, by the analogy between ultrafilters and maximal ideals shown in Proposition 3.1.10 below. They are those ultrafilters containing the Fréchet filter consisting of sets with finite complement.

**Definition 3.1.6.** The *Fréchet filter* is the collection of subsets of the natural number defined as

$$\mathcal{F} = \{S \subset \mathbb{N} : \mathbb{N} \setminus S \text{ finite}\}$$

### 3.1.2 Analogy between ultrafilters and ideals

The set  $\mathbb{P}(\mathbb{N})$  can be endowed with a natural structure of a boolean ring. In order to do that, we define a set-theoretic bijection to the functions on the naturals with values on the finite field with two elements  $\mathbb{F}_2$ :

$$\mathbb{P}(\mathbb{N}) \rightarrow \mathcal{C}(\mathbb{N}, \mathbb{F}_2) : A \mapsto 1 - \chi_A$$

where  $\chi_A$  is the characteristic function. The natural boolean structure in  $\mathcal{C}(\mathbb{N}, \mathbb{F}_2)$  induces, via the above bijection, a boolean ring structure in  $Pb(\mathbb{N})$ . It is possible to explicitly describe the operations in  $\mathbb{P}(\mathbb{N})$ .

**Definition 3.1.7.** The *filtered* boolean structure  $\mathcal{B}(\mathbb{N})$  in  $\mathbb{P}(\mathbb{N})$  is given by the operations

$$A + B = (A \cap B) \cup (A^c \cap B^c), \quad A \cdot B = (A \cup B)$$

where  $S^c$  denotes the complementary set and  $\Delta$  denotes the symmetric difference.

**Remark 3.1.8.** The boolean ring structure in 3.1.7 is not the standard one in the literature, but it is the conjugation by the involution obtained by sending each set to its complementary.

We can now identify filters and ultrafilters with ideals and maximal ideals<sup>1</sup>.

**Proposition 3.1.9.** The filters coincides with the ideals in the boolean ring in  $\mathbb{P}(\mathbb{N})$  which are different to 1.

---

<sup>1</sup>With the standard convention, filters (resp. ultrafilters) are the set of complements of ideals (resp. maximal ideals)

*Proof.* Let  $\mathcal{F}$  be a filter in  $\mathbb{P}(\mathbb{N})$  and let  $A, B \in \mathcal{F}$ . Then

$$A + B = (A \cap B) \cup (A^c \cap B^c) \supset A \cap B \in \mathcal{F}$$

by (F1). Therefore,  $A + B \in \mathcal{F}$  by (F2). If  $T \subset N$ , then

$$A \cdot T = A \cup T \supset A \in \mathcal{F}$$

by (F2). Finally, (F0) implies that  $\mathcal{F}$  is not the full  $\mathcal{P}(\mathcal{N})$ .

Conversely, assume  $\mathcal{F}$  is an ideal strictly contained in  $\mathbb{P}(\mathbb{N})$ . Since the unit element in  $\mathbb{P}(\mathbb{N})$  is the empty set, then (F0) needs to hold. Assume that  $S \in \mathcal{F}$  and  $S \subset T$ , then  $T = S \cdot T$ , so it belongs to  $\mathcal{F}$ , which proves (F2). Finally, if  $A, B \in \mathcal{F}$ , then

$$A \cap B \subset (A \cap B) \cup (A^c \cap B^c) = A + B \in \mathcal{F}$$

Then  $A \cap B = (A + B) \cdot (A \cap B)$ , so (F1) holds.  $\square$

**Proposition 3.1.10.** The ultrafilters in  $\mathbb{P}(\mathbb{N})$  are exactly the maximal ideals of  $\mathcal{B}(\mathbb{N})$ .

*Proof.* Let  $\mathcal{U}$  be an ultrafilter. By Proposition 3.1.9,  $\mathcal{U}$  is an ideal of  $\mathcal{B}(\mathbb{N})$ . Let  $A = \mathbb{P}(\mathbb{N})/\mathcal{U}$  be its quotient ring. Note that, for any  $S \subset \mathbb{N}$ , then either  $S \in \mathcal{U}$  or

$$S = \emptyset + S^c \in \emptyset + \mathcal{U}$$

because  $S^c \in \mathcal{U}$  by (UF). Hence  $A$  is the ring with two elements, so its a field and hence  $\mathcal{U}$  is a maximal ideal.

Conversely, assume  $\mathcal{U}$  is a maximal ideal, so  $A = \mathbb{P}(\mathbb{N})/\mathcal{U}$  is a boolean field. Then  $A = \mathbb{F}_2$  since every element is a root of  $x(x-1)$ . Then, for any  $S \subset \mathbb{N}$ , either  $S \in \mathcal{U}$  or  $1 + S \in \mathcal{U}$ . This is equivalent to (UF) since  $1 + S = \emptyset + S = S^c$ .  $\square$

### 3.1.3 Ultraproducts

In this section, we will use the concept of ultrafilters to patch sequences of sets.

**Definition 3.1.11.** Let  $\mathcal{U}$  be an ultrafilter and let  $(M_n)_{n \in \mathbb{N}} \in \mathcal{C}^{\mathbb{N}}$ . The *ultraproduct*  $\mathcal{U}(M_n)$  is defined as

$$\mathcal{U}(M_n) = \prod_{n \in \mathbb{N}} M_n / \sim$$

where  $\sim$  is the equivalence relation defined as  $(m_n) \sim (m'_n)$  if  $m_n = m'_n$  for  $\mathcal{U}$ -many  $n$ .

**Proposition 3.1.12.** (Functoriality of the ultraproduct, [Swe22, Proposition 2.1.4]) The ultraproduct  $\mathcal{U}$  defines a functor  $\mathcal{C}^{\mathbb{N}} \rightarrow \mathcal{C}$ .

*Proof.* Let  $\varphi : (A_n) \rightarrow (B_n)$  be a morphism in  $\mathcal{C}^{\mathbb{N}}$ . By definition,  $\varphi$  is a collection of morphisms  $\varphi_i : A_i \rightarrow B_i$ . Their product induces a morphism

$$\bar{\varphi} = \prod_{n \in \mathbb{N}} \varphi_n : \prod_{n \in \mathbb{N}} A_n \rightarrow \prod_{n \in \mathbb{N}} B_n$$

This product morphism restricts well to the ultraproduct, resulting in a map

$$\varphi^{\mathcal{U}} : \mathcal{U}(A_n) \rightarrow \mathcal{U}(B_n)$$

Indeed, if  $(\alpha_i), (\alpha'_i) \in \prod_{n \in \mathbb{N}} A_n$  are two equivalent sequences, then  $\alpha_i = \alpha'_i$  for  $\mathcal{U}$ -many  $i$ . Then  $\varphi(\alpha_i) = \varphi(\alpha'_i)$  for  $\mathcal{U}$ -many  $i$ . It implies that  $\overline{\varphi}(\alpha_i)$  and  $\overline{\varphi}(\alpha'_i)$  are equivalent sequences in  $\prod_{n \in \mathbb{N}} B_n$ . Hence,  $\varphi^{\mathcal{U}}$  is well defined and, since it clearly behaves well with the composition, the ultraproduct is functorial.  $\square$

The ultraproduct also behave well with direct products.

**Proposition 3.1.13.** If  $(A_n)$  and  $(B_n)$  are sequences of sets, modules or rings, there is a canonical identification

$$\mathcal{U}(A_n \times B_n) = \mathcal{U}(A_n) \times \mathcal{U}(B_n)$$

*Proof.* The canonical map

$$\prod_{n \in \mathbb{N}} A_n \times B_n \rightarrow \left( \prod_{n \in \mathbb{N}} A_n \right) \times \prod_{n \in \mathbb{N}} B_n, (a_n, b_n)_{n \in \mathbb{N}} \mapsto [(a_n)_{n \in \mathbb{N}}, (b_n)_{n \in \mathbb{N}}]$$

respects the equivalence relation given by the ultrafilter. Indeed, if two sequences  $\{(a_n, b_n)\}_{n \in \mathbb{N}}$  and  $\{(a'_n, b'_n)\}_{n \in \mathbb{N}}$  are equivalent, the set

$$S := \{n \in \mathbb{N} : (a_n, b_n) = (a'_n, b'_n)\} \in \mathcal{U}$$

Therefore, by (F2),

$$S_a = \{n \in \mathbb{N} : a_n = a'_n\} \in \mathcal{U}$$

since it contains  $S$ . Hence  $(a_n)$  is equivalent to  $(a'_n)$ . Similarly,  $(b_n)$  and  $(b'_n)$  are also equivalent. Then the map  $\mathcal{U}(A_n \times B_n) \rightarrow \mathcal{U}(A_n) \times \mathcal{U}(B_n)$  is well defined.

Conversely, if we have two pair of equivalent sequences  $(a_n)$  and  $(a'_n)$ , and  $(b_n)$  and  $(b'_n)$ . We denote by  $S_a$  and  $S_b$  the set of indices in which they coincide, then

$$\{n \in \mathbb{N} : (a_n, b_n) = (a'_n, b'_n)\} = S_a \cap S_b \in \mathcal{U}$$

by (F1). Then  $(a_n, b_n)$  and  $(a'_n, b'_n)$  are two equivalent sequences in  $(A_n \times B_n)$ , so the inverse map  $\mathcal{U}(A_n) \times \mathcal{U}(B_n) \rightarrow \mathcal{U}(A_n \times B_n)$  is also well defined.  $\square$

The behavior of the ultrafilter with the Hom functor is not as satisfying, since we only get an injective map.

**Proposition 3.1.14.** Let  $A_n, B_n$  be two sequences in  $\mathcal{C}^{\mathbb{N}}$ . Then there is an injection

$$\Psi : \mathcal{U}(\text{Hom}(A_n, B_n)) \hookrightarrow \text{Hom}(\mathcal{U}(A_n), \mathcal{U}(B_n))$$

*Proof.* Let  $(\varphi_n)$  be the sequence representing an element in  $\mathcal{U}(\text{Hom}(A_n, B_n))$  and let  $(a_n)$  be a sequence representing an element in  $B_n$ . We assign the sequence  $\varphi_n(a_n) \in \mathcal{U}(B_n)$ . Clearly, this assignment behaves well under the ultrafilter equivalences in both  $\mathcal{U}(\text{Hom}(A_n, B_n))$  and  $\mathcal{U}(A_n)$ , so it defines a map

$$\Psi : \mathcal{U}(\text{Hom}(A_n, B_n)) \rightarrow \text{Hom}(\mathcal{U}(A_n), \mathcal{U}(B_n))$$

In order to check injectivity, consider another sequence  $(\psi_n)$  induces the same element in  $\text{Hom}(\mathcal{U}(A_n), \mathcal{U}(B_n))$ . For the sake of contradiction, assume that  $(\varphi_n)$  and  $(\psi_n)$  are not equivalent, i.e., the set

$$S = \{n \in \mathbb{N} : \varphi_n \neq \psi_n\} \in \mathcal{U}$$

Choose a sequence  $(a_n) \in (A_n)$  where  $\varphi_n(a_n) \neq \psi_n(a_n)$  for every  $n \in S$ . Hence  $(\varphi_n(a_n))$  and  $(\psi_n(a_n))$  represent different elements in  $\mathcal{U}(B_n)$ , so  $\Psi(\varphi_n) \neq \Psi(\psi_n)$ .  $\square$

**Notation 3.1.15.** If  $M$  is a set, we will denote by  $\mathcal{U}(M)$  to the ultraproduct of the sequence  $(M_n)$  in which  $M_n = M$  for all  $n$ .

**Remark 3.1.16.** If  $M_n$  have some extra structure such as pointed sets, groups or rings, the ultraproduct  $\mathcal{U}(M_n)$  would also be endowed with such structure.

**Proposition 3.1.17.** ([Swe22, proposition 2.1.5]) Assume  $\mathcal{C}$  is a category of pointed sets. Then the ultraproduct  $\mathcal{U}$  is an exact functor.

*Proof.* We will denote by 0 the distinguished point in every object of  $\mathcal{C}$ . Assume we have an exact sequence in  $\mathcal{C}^{\mathbb{N}}$ ,

$$0 \longrightarrow (A_n) \xrightarrow{\bar{\mu}} B_n \xrightarrow{\bar{\varepsilon}} C_n \xrightarrow{0} 0$$

We start by showing the injectivity of  $\mu^{\mathcal{U}}$ . Let  $\alpha = (\alpha_n) \in \ker(\mu^{\mathcal{U}})$ , which means that  $\mu_i(\alpha_i) = 0$  for  $\mathcal{U}$ -many  $i$ . Since  $\mu_i$  are injective maps, then  $\alpha_i = 0$  for  $\mathcal{U}$ -many  $i$ , so  $(\alpha_i) \equiv 0$  in  $\mathcal{U}(A_n)$ . Thus  $\mu^{\mathcal{U}}$  is injective.

The composition of  $\varepsilon^{\mathcal{U}} \circ \mu^{\mathcal{U}}$  vanishes, since  $\bar{\varepsilon} \circ \bar{\mu}$  also does. Conversely, let  $\beta = (\beta_n) \in \ker(\varepsilon^{\mathcal{U}})$ . Let  $S_{\beta}$  be the set of indices such that  $\varepsilon_i(\beta_i) = 0$ . For those indices,  $\beta_i \in \text{Im}(\mu_i)$ . We can thus define  $\alpha = (\alpha_i)$  by

$$\begin{cases} \alpha_i \in \mu_i^{-1}(\beta_i) & \text{if } i \in S_{\beta} \\ \alpha_i = 0 & \text{if } i \notin S_{\beta} \end{cases}$$

Clearly  $(\mu_i(\alpha_i))$  is equivalent to  $(\beta_i)$ , so  $\beta \in \mu^{\mathcal{U}}$ .

Finally, the surjectivity of  $\varepsilon^{\mathcal{U}}$  follows from being a quotient map of the surjective map  $\bar{\varepsilon}$ .  $\square$

In general, it is difficult to compute the ultraproduct, but there is a special case in which it is explicit, when we have sequence of finite sets of bounded order.

**Lemma 3.1.18.** Let  $(M_n)$  be a sequence of sets satisfying that there is a finite set such that  $M_n = M$  for all  $n$ . Then the diagonal map  $\Delta : M \rightarrow \mathcal{U}(M_n)$  is an isomorphism.

*Proof.* By (F0), the above map is clearly injective, so we only need to check surjectivity. A sequence  $(m_n) \in \prod_{n \in \mathbb{N}} M$  induces a map

$$f : \mathbb{N} \rightarrow M : m \mapsto m_n$$

Since  $M$  is finite, corollary 3.1.3 implies that there exists a unique  $m \in M$  such that  $f^{-1}(\{m\}) \in \mathcal{U}$ . Hence  $(m_n)$  is equivalent to the constant sequence  $(m)$ , so it belongs to the image of  $\Delta$ .  $\square$

**Corollary 3.1.19.** Let  $M_n$  be a sequence of finite sets whose orders are bounded above by some constant  $C$ . Then the ultraproduct  $\mathcal{U}(M_n)$  is finite with order less by  $C$ .

*Proof.* Let  $S$  be a set of cardinality  $C$ . For each  $n \in \mathbb{N}$ , fix an injection

$$\mu_n : M_n \hookrightarrow S$$

By Proposition 3.1.17 and Lemma 3.1.18, there is an injection

$$\mathcal{U}(M_n) \hookrightarrow \mathcal{U}(S) \cong S$$

Thus,  $\mathcal{U}(M_n)$  is finite with order bounded by  $C$ .  $\square$

### 3.1.4 Ultraprimes

An example of ultraproduct of infinite sets leads to the concept of ultraprimes, which are the elements in the ultraproduct of the constant sequence of the set of prime numbers. We will not attempt to give a description of this ultraproduct, but its elements will play an important role in this theory.

Fix a non-principal ultrafilter  $\mathcal{U}$  and a number field  $K$ . Denote by  $\mathbb{P}$  the set of primes in  $K$ .

**Definition 3.1.20.** An *ultraprime*  $\mathfrak{u}$  is an element of  $\mathcal{U}(\mathbb{P})$ . More specifically, it is represented by a sequence of prime numbers  $(\ell_n)_{n \in \mathbb{N}}$ , and two sequences represent the same ultraprime if they coincide in  $\mathcal{U}$ -many primes.

**Remark 3.1.21.** The primes  $\mathbb{P}$  are contained in the ultraprimes  $\mathcal{U}(\mathbb{P})$  via the diagonal map, i.e., a prime  $\ell$  is identified with the equivalence class of the constant sequence  $(\ell)$ . The image of  $\mathbb{P} \hookrightarrow \mathcal{U}(\mathbb{P})$  is sometimes referred as *constant ultraprimes*.

We can use Corollary 3.1.3 to define the Frobenius element associated to an ultraprime  $\mathfrak{u}$  in the absolute Galois group  $G_K$ .

**Proposition 3.1.22.** Let  $\mathfrak{u} = (\ell_n)$  be an ultraprime and let  $L/K$  be a finite Galois extension of number fields. Then there exists a unique element  $\sigma$  such that  $\text{Frob}_{\ell_n}|_{L/K} = \sigma$  for  $\mathcal{U}$ -many  $n$ . This element is called the *Frobenius* automorphism of  $\mathfrak{u}$  at  $L/K$ .

*Proof.* The sequence  $(\ell_n)$  defines a map

$$F : \mathbb{N} \rightarrow \text{Gal}(L/K) : n \mapsto \text{Frob}_{\ell_n}$$

Since  $\text{Gal}(L/K)$  is finite, Corollary 3.1.3 says that there exists a unique  $\sigma \in \text{Gal}(L/K)$  such that  $F^{-1}(\{\sigma\}) \in \mathcal{U}$ .

If we take an equivalent sequence  $\ell'_n$ , the set

$$S = \{n \in \mathbb{N} : \ell_n = \ell'_n\} \in \mathcal{U}$$

Then, by (F1) and (F2)

$$S \cap F^{-1}(\{\sigma\}) \subset \{n \in \mathbb{N} : \text{Frob}_{\ell'_n} = \sigma\} \in \mathcal{U}$$

Hence the definition of  $\text{Frob}_{\mathbf{u}}$  is independent of the sequence representing it.  $\square$

**Definition 3.1.23.** Let  $\mathbf{u} = (\ell_n)$  be an ultraprime. The Frobenius automorphism  $\text{Frob}_{\mathbf{u}}$  is defined as

$$\text{Frob}_{\mathbf{u}} = (\text{Frob}_{\mathbf{u}}|_{L/K})_{L/K} \in \varprojlim_{L/K} \text{Gal}(L/K) = G_K$$

**Remark 3.1.24.** In order to guarantee that Definition 3.1.23 is consistent, we need to show that  $\text{Frob}_{\mathbf{u}}$  behaves well under the restriction of finite extensions  $L'/L$ . Let  $(\ell_n)$  be a sequence representing  $\mathbf{u}$  such that  $\text{Frob}_{\ell_n}|_{L'} = \sigma$ , for some  $\sigma \in \text{Gal}(L'/K)$  for  $\mathcal{U}$ -many  $n$ . For all those  $n$ ,  $\text{Frob}_{\ell_n}|_L = \sigma|_L$ , so  $\sigma|_L$  coincides with  $\text{Frob}_{\ell_n}$  for  $\mathcal{U}$ -many  $n$ .

**Remark 3.1.25.** Definition 3.1.23 is consistent with the standard definition of Frobenius automorphisms: if  $\mathbf{u} = (\ell)$  is a constant ultraprime, then  $\text{Frob}_{\mathbf{u}} = \text{Frob}_{\ell}$ .

Ultraprimes have their own version of Chebotarev density theorem, which is stronger than the classical version. Its main advantage is that it is not longer restricted to finite extensions.

**Definition 3.1.26.** Let  $K$  be a number field and let  $\sigma \in G_K$ , there exists an ultraprime  $\mathbf{u}$  such that  $\text{Frob}_{\mathbf{u}} = \sigma$ .

*Proof.* Let  $(L_n)_{n \in \mathbb{N}}$  be an ordering of all the finite extensions of  $K$ . For every  $n \in \mathbb{N}$ , define  $E_n = L_1 \cdots L_n$ . By Chebotarev's density theorem, there exists a prime  $\ell_n$  such that  $\text{Frob}_{\ell_n} = \sigma|_{E_n}$ .

Consider the prime  $\mathbf{u} = (\ell_n)$ . Let  $L$  be a number field. Then there exists a natural number  $n_0$  such that  $L = L_{n_0}$ . Then  $\text{Frob}_{\ell_n}|_L = \sigma_L$  for all  $n \geq n_0$  and, therefore, for  $\mathcal{U}$ -many  $\mathcal{N}$ . Hence  $\text{Frob}_{\mathbf{u}}|_L = \sigma_L$  for all number fields  $L$ , so  $\text{Frob}_{\mathbf{u}} = \sigma$ .  $\square$

The construction of the Frobenius is used to artificially define the local Galois group at the ultraprime. It is a generalization of the tame quotient of the classical local Galois groups.

**Definition 3.1.27.** Let  $\mathbf{u}$  be a non-constant ultraprime. The *local Galois group*  $G_{\mathbf{u}}$  is defined as the semidirect product  $\widehat{\mathbb{Z}}(1) \rtimes \langle \text{Frob}_{\mathbf{u}} \rangle$ , where  $\langle \text{Frob}_{\mathbf{u}} \rangle$  is the free profinite group generated by one element which acts by  $\text{Frob}_{\mathbf{u}} \in G_K$  on  $\widehat{\mathbb{Z}}(1)$ .

The *inertia subgroup*  $I_{\mathbf{u}} \subset G_{\mathbf{u}}$  is the normal subgroup  $\widehat{\mathbb{Z}}(1)$ .

**Remark 3.1.28.** Note that, when  $\mathbf{u}$  is a constant ultraprime, the semidirect product  $\widehat{\mathbb{Z}}(1) \rtimes \langle \text{Frob}_{\mathbf{u}} \rangle$  coincides with the tame inertia quotient of the Galois group  $G_{\mathbf{u}}$ .

We impose that  $G_u$  acts unramifiedly on Galois modules.

**Definition 3.1.29.** Let  $T$  be a  $G_K$ -module. We define an action of  $G_u$  on  $T$  via the quotient  $G_u \twoheadrightarrow \langle \text{Frob}_u \rangle$ .

## 3.2 Patched cohomology

### 3.2.1 Construction

In this section, we use the ultraproduct defined in the previous one to introduce the notion of patched cohomology. In order to have control over the patched cohomology groups, we define it first for finite coefficient rings as an ultraproduct of cohomology groups, and then we extend the definition to either profinite or ind-finite coefficient rings by taking limits.

**Definition 3.2.1.** Let  $T$  be a finite group endowed with actions from a sequence groups  $G = (G_n)_{n \in \mathbb{N}} \in \mathcal{U}(\{\text{groups}\})$  (technically, it is only needed that the action is well defined for  $\mathcal{U}$ -many  $n$ ). The  $\mathcal{U}$ -patched cohomology group is defined as

$$\mathbf{H}^i(G, T) = \mathcal{U}(H^i(G_n, T))$$

If  $T$  is a profinite group, we define the patched cohomology as

$$\mathbf{H}^i(G, T) = \varprojlim_{T \twoheadrightarrow T'} \mathbf{H}^i(G, T/T')$$

where the limit is taken over all the finite quotients of  $T$ .

Similarly, when  $T$  is an ind-finite group, the patched cohomology is defined as

$$\mathbf{H}^i(G, T) = \varinjlim_{T' \hookrightarrow T} \mathbf{H}^i(G, T')$$

where the limit is taken over all the finite subgroups of  $T$ .

**Proposition 3.2.2.** The assignment

$$T \mapsto \mathbf{H}^i(G, T)$$

is a functor from the category of either finite groups, pro-finite groups and ind-finite groups to the category of groups.

*Proof.* It follows from the functorial properties of cohomology groups, ultraproducts and inverse and direct limits.  $\square$

**Proposition 3.2.3.** Let

$$0 \longrightarrow A \xrightarrow{\mu} B \xrightarrow{\varepsilon} C \longrightarrow 0$$

be an exact sequence of continuous maps of profinite groups. Assume  $A$ ,  $B$  and  $C$  are endowed with an action of  $G = (G_n)$ . Then there is a long cohomological exact sequence

diagram of long cohomology sequence

*Proof.* Let  $I$  be a directed set indexing the finite quotients of  $B$ , i.e., all the finite quotients of  $B$  are of the form  $B/\beta_i$ , for some  $i \in I$ . Since  $B$  is profinite, we have that

$$\bigcap_{i \in I} \beta_i = 0$$

Since  $\mu$  is injective,

$$\bigcap_{i \in I} \mu^{-1}(\beta_i) = 0$$

Hence they  $A$  can be computed as the inverse limit

$$H^i(G, A) = \varprojlim_{A \twoheadrightarrow A'} \mathbf{H}^i(G, A') = \varprojlim_{i \in I} \mathbf{H}^i(G, A/\mu^{-1}(\beta_i))$$

Similarly,

$$\bigcap_{i \in I} \varepsilon(\beta_i) = 0$$

Thus,

$$H^i(G, C) = \varprojlim_{C \twoheadrightarrow C'} \mathbf{H}^i(G, C/C') = \varprojlim_{i \in I} \mathbf{H}^i(G, C/\varepsilon(\beta_i))$$

**review null intersection and inverse limit (cofinal)** For each  $i \in I$ , there is an exact sequence

$$0 \longrightarrow A/\mu^{-1}(\beta_i) \xrightarrow{\mu} B/\beta_i \xrightarrow{\varepsilon} C/\varepsilon(\beta_i) \longrightarrow 0$$

For each  $n$  there is a long exact sequence in the cohomology of  $G_n$ . Since the  $\mathcal{U}$ -patching is an exact functor, it induces a long exact sequence in the patching cohomology of the finite quotients: **diagram**

**Conditions for inverse limit to be exact** □

### 3.2.2 Local patched cohomology

In this section, we outline the basic properties of the local cohomology at an ultraprime  $\mathfrak{u}$ , defined as the patching of the local cohomology of the primes defining  $\mathfrak{u}$ .

**Definition 3.2.4.** Let  $\mathfrak{u}$  be an ultraprime represented by the sequence  $(\ell_n)$ . The local patched cohomology group is defined as

$$\mathbf{H}^i(K_{\mathfrak{u}}, T) := \mathbf{H}^i((G_{K_{\ell_n}}), T)$$

In the local case, the local patched cohomology coincides the group cohomology of the local Galois group defined in Definition 3.1.27.

**Proposition 3.2.5.** Let  $T$  be an  $R[[G_K]]$ -module either finite, profinite or ind-finite, and let  $\mathfrak{u}$  be an ultraprime represented by the sequence  $(\ell_n)$ . Then

$$\mathbf{H}^i(K_{\mathfrak{u}}, T) = \mathbf{H}^i(G_{\mathfrak{u}}, T)$$

*Proof.* By taking limits, we only need to prove it when  $T$  is finite. If  $\mathfrak{u}$  is a constant ultraprime, it follows from the finiteness of classical local Galois cohomology and Lemma 3.1.18.

Hence we can assume that  $\mathcal{U}$  is a non-constant ultraprime. For  $\mathcal{U}$ -many  $n$ , the action of  $G_{\ell_n}$  on  $T$  is unramified,  $\text{Frob}_{\ell_n}$  acts on  $T$  like  $\text{Frob}_{\mathfrak{u}}$  and  $\ell_n \nmid \#T$ . For those values, we have that

$$H^i(G_{\ell_n}, T) = H^i(G_{\ell_n}^t, T)$$

where  $G_{\ell_n}^t$  is Galois group of the maximal tamely ramified extension. complete  $\square$

From this prove, we can prove the following corollary.

**Corollary 3.2.6.** Let  $\mathfrak{u} = (\ell_n)$  be an ultraprime and let  $T$  be a finite group endowed with an action of  $G_{\mathfrak{u}}$ . For  $\mathcal{U}$ -many  $n$ , there is an isomorphism

$$\varphi_i^{\mathfrak{u}} : \mathbf{H}^1(K_{\mathfrak{u}}, T) \cong H^1(K_{\ell_i}, T)$$

**Definition 3.2.7.** (Cohomology of the inertia subgroup) Let  $\mathfrak{u}$  an ultraprime represented by the sequence  $(\ell_n)$ . The cohomology of the inertia subgroup is the patching

$$\mathbf{H}^i(\mathcal{I}_{\mathfrak{u}}, T) = \mathbf{H}^i(I_{\ell_n}, T)$$

**Definition 3.2.8.** (Finite cohomology) We define the *finite cohomology* group as

$$\mathbf{H}_{\mathfrak{f}}^1(K_{\mathfrak{u}}, T) = \ker\left(\mathbf{H}^1(K_{\mathfrak{u}}, T) \rightarrow \mathbf{H}^1(I_{\mathfrak{u}}, T)\right)$$

### local duality

We can generalise the concept of Kolyvagin primes to this setting, with the advantage that there are Kolyvagin ultraprimes even for infinite coefficient rings. In order to define this notion, we need to set some assumptions

**Assumption 3.2.9.** Let  $R$  be a profinite, local ring that can be described as

$$R = \varprojlim R_n$$

where  $R_n$  is a self-injective, finite, local ring. In addition, let  $T$  be a  $R[[G_K]]$ -module that is finitely generated as  $R$ -module.

**Notation 3.2.10.** Recall that  $K(T)$  is the kernel of the action  $\rho : G_K \rightarrow \text{Aut}(T)$  and let

$$K(T)_{p^\infty} = K(T)K(1)(\mu_{p^\infty})$$

**Assumption 3.2.11.** In addition, we assume the following assumptions:

- (T1)  $T/\mathfrak{m}T$  is an irreducible  $k[[G_K]]$ -module.
- (T2) There exists  $\tau \in G_{K_M}$  such that  $T/(\tau - 1)T \cong R$  as  $R$ -modules.
- (T3)  $H^1(K(T)_{p^\infty}/K, T) = H^1(K(T)_{p^\infty}/K, T^*(1)) = 0$ .

**Definition 3.2.12.** An ultraprime is said to be a *Kolyvagin ultraprime* if  $\text{Frob}_{\mathfrak{u}}$  is conjugate to  $\tau$  in  $\text{Gal}(K(T)_{p^\infty}/K)$ .

We can describe explicitly the local cohomology of Kolyvagin ultraprimes.

**Proposition 3.2.13.** Let  $\mathfrak{u}$  be a Kolyvagin ultraprime. Then there is an homomorphism

$$\mathbf{H}_f^1(K_{\mathfrak{u}}, T) \cong T/(\text{Frob}_{\mathfrak{u}} - 1)T$$

Local Tate duality extend to patched cohomology.

**Proposition 3.2.14.** (Local duality) Let  $T$  be either a finite, profinite or ind-finite group and let  $\mathfrak{u} = (\ell_n)$  be an ultraprime. Then there is a non-degenerate pairing

$$\mathbf{H}^1(K_{\mathfrak{u}}, T) \times \mathbf{H}^1(K_{\mathfrak{u}}, T^*) \rightarrow \mathbb{Q}/\mathbb{Z}$$

*Proof.* Assume first that  $T$  is finite. Then

$$\mathbf{H}^1(K_{\mathfrak{u}}, T) = \mathcal{U}(H^1(K_{\ell_n}, T)), \quad \mathbf{H}^1(K_{\mathfrak{u}}, T^*) = \mathcal{U}(H^1(K_{\ell_n}, T^*))$$

Hence, by Proposition 3.1.13

$$\mathbf{H}^1(K_{\mathfrak{u}}, T) \times \mathbf{H}^1(K_{\mathfrak{u}}, T^*) = \mathcal{U}\left(H^1(K_{\ell_n}, T) \times H^1(K_{\ell_n}, T^*)\right)$$

Classical Tate duality, together with the functoriality of the ultraproduct, induces a pairing

$$\mathbf{H}^1(K_{\mathfrak{u}}, T) \times \mathbf{H}^1(K_{\mathfrak{u}}, T^*) \rightarrow \mathcal{U}\left(\frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}}\right) = \frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}}$$

Since classical local duality is non-degenerate, and the ultraproduct is an exact functor, there is an injection

$$\mathcal{U}(H^1(K_{\ell_n}, T)) \hookrightarrow \mathcal{U}\left(\text{Hom}\left(H^1(K_{\ell_n}, T^*), \frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}}\right)\right)$$

Applying Proposition 3.1.14, we also obtain the injection

$$\mathcal{U}(H^1(K_{\ell_n}, T)) \hookrightarrow \text{Hom}\left(\mathcal{U}(H^1(K_{\ell_n}, T^*)), \mathcal{U}\left(\frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}}\right)\right)$$

Therefore, the patched local duality pairing is non-degenerate on the left. Similarly, it is also non-degenerate on the right factor.

□

finite cohomology annihilators

### 3.2.3 Global patched cohomology

The first goal of this section is defining the concept of the patched cohomology group outside the square-free (formal) product of ultraprimes.

**Definition 3.2.15.** Let  $\mathfrak{u}_1 = (\ell_k^{(1)})_{k \in \mathbb{N}}, \dots, \mathfrak{u}_s = (\ell_k^{(s)})_{k \in \mathbb{N}}$  be a finite set of (distinct) ultraprimes. Its product is defined as

$$\mathfrak{u}_1 \cdots \mathfrak{u}_s = (\ell_n^1 \cdots \ell_n^{(s)})_{n \in \mathbb{N}} \in \mathcal{U}(\mathbb{N})$$

The set of square-free products of Kolyvagin ultraprimes is denoted by  $\mathcal{N}$ .

**Definition 3.2.16.** ([Swe22, Definition 2.4.2]) Let  $T$  be either a finite, profinite or ind-finite  $R[[G_K]]$  module and let  $\mathfrak{n} \in \mathcal{N}$  be represented by the sequence  $(n_i)$ . We defined the maximal patched cohomology group unramified at  $\mathfrak{n}$  by

$$\mathbf{H}^i(K^\mathfrak{n}/K, T) := \mathbf{H}^i(\mathrm{Gal}(K^{n_i}/K), T^{G_{K^{n_i}}})$$

where  $K^{n_i}$  represents the maximal extension of  $K$  unramified outside the prime divisors of  $n_i$ . Note that this definition is independent of the sequence representing  $\mathfrak{n}$ .

**Notation 3.2.17.** If  $S$  is a finite set of distinct ultraprimes and  $n$  is the product of all the ultraprimes in  $S$ , we will also denote  $\mathbf{H}^i(K^\mathfrak{n}/K, T)$  by  $\mathbf{H}^i(K^S/K, T)$ .

The basic property of the global patched finite groups is its finiteness.

**Proposition 3.2.18.** ([Swe22, Lemma 2.4.5.]) Let  $T$  be a finite group unramified outside a finite set  $S \subset \mathcal{U}(\mathbb{P})$ . The patched cohomology groups  $\mathbf{H}^i(K^S/K, T)$  are finite for all  $i \geq 0$ .

**Proof**

**Remark 3.2.19.** If  $S_1 \subset S_2 \subset \mathcal{U}(\mathbb{P})$  are two finite sets of ultraprimes. Then there is a natural map

$$\mathbf{H}^1(K^{S_1}/K, T) \hookrightarrow \mathbf{H}^1(K^{S_2}/K, T)$$

When  $T$  is finite, it is induced by a sequence of inflation maps. The general case, when  $T$  is profinite and ind-finite, follows by taking limits.

**Definition 3.2.20.** ([Swe22, p. 2.4.6.]) Assume that  $T$  is unramified outside a finite set of primes  $S_0$ . The absolute global patched cohomology group is defined as

$$\mathbf{H}^1(K, T) = \varinjlim_{S_0 \subset S \subset \mathcal{U}(\mathbb{P})} \mathbf{H}(K^S/K, T)$$

where the limit is taken over all the finite sets and the transition maps are the ones defined in Remark 3.2.19.

**Definition 3.2.21.** Let  $S$  be a finite set of ultraprimes and let  $\mathfrak{u}$  be an ultraprime. There exists a restriction map

$$\mathrm{res} : \mathbf{H}^1(K^S/K, T) \rightarrow \mathbf{H}^1(K_\mathfrak{u}, T)$$

induced, when  $T$  is finite, by the restriction map in every factor of the ultraproduct. When  $T$  is profinite (resp. ind-finite),  $\mathrm{res}$  is obtained as the limit of the restriction map in the cohomology of the finite quotients (resp. submodules).

We now show that the above definition is, in fact, the unramified subgroup of the global patched cohomology.

**Proposition 3.2.22.** ([Swe22, Proposition 2.4.11.]) Let  $S \subset \mathcal{U}(\mathbb{P})$  be a finite set of ultraprimes and let  $T$  be unramified outside  $S_0$ . Then

$$\mathbf{H}^1(K^S/K, T) = \ker \left( \mathbf{H}^1(K, T) \rightarrow \prod_{\mathfrak{u} \in \mathcal{U}(\mathbb{P}) \setminus S} \frac{\mathbf{H}^1(K_\mathfrak{u}, T)}{\mathbf{H}^1(\mathcal{I}_\mathfrak{u}, T)} \right)$$

### 3.3 Patched Selmer groups

#### 3.3.1 Patched Selmer structures

Following [Swe22], we can now define the Selmer structures in this setting. The main innovation is they also include local conditions at non-constant ultraprimes.

**Definition 3.3.1.** A *Selmer structure*  $\mathcal{F}$  is a consists of the following data:

- A finite set  $\Sigma_{\mathcal{F}}$  of  $\mathcal{U}(\mathbb{P})$  containing all constant ultraprimes lying over  $p$ ,  $\infty$  or ramified primes of  $T$ .
- For each  $\mathfrak{u} \in S$ , a closed  $R$ -submodule

$$\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) \subset \mathbf{H}^1(K_{\mathfrak{u}}, T)$$

**Definition 3.3.2.** The Selmer group of a Selmer structure  $\mathcal{F}$  is defined as

$$\mathbf{H}_{\mathcal{F}}^1(K, T) := \ker \left( \mathbf{H}^1(K^{\Sigma}/K, T) \rightarrow \prod_{\mathfrak{u} \in \Sigma} \frac{\mathbf{H}^1(K_{\mathfrak{u}}, T)}{\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T)} \right)$$

**Remark 3.3.3.** By Proposition 3.2.22, a Selmer structure depend only on the local conditions. If we set  $\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) := \mathbf{H}_{\mathfrak{f}}^1(K_{\mathfrak{u}}, T)$  whenever  $\mathfrak{u} \notin \mathcal{F}$ , then

$$\mathbf{H}_{\mathcal{F}}^1(K, T) = \ker \left( \mathbf{H}^1(K, T) \rightarrow \prod_{\mathfrak{u} \in \mathcal{U}(\mathbb{P})} \frac{\mathbf{H}^1(K_{\mathfrak{u}}, T)}{\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T)} \right)$$

**Remark 3.3.4.** Local conditions propagate to quotients and submodules as in Definitions 1.2.7 and 1.2.8.

We can recover the Selmer group as the limit of the propagated Selmer groups with finite coefficients.

**Proposition 3.3.5.** ([Swe22, Proposition 2.5.6]) Let  $T$  be a profinite group and let  $\mathcal{F}$  be a Selmer structure defined on  $T$ . Then

$$\mathbf{H}_{\mathcal{F}}^1(K, T) = \varprojlim_{T \twoheadrightarrow T'} \mathbf{H}_{\mathcal{F}}^1(K, T')$$

where the limit is taken over the finite quotients  $T'$  of  $T$  and  $\mathbf{H}_{\mathcal{F}}^1(K, T')$  is the Selmer group of the propagated Selmer structure, as defined in Definition 1.2.7.

*Proof.* Since the inverse limit is exact on finite groups,

$$\begin{aligned} \lim_{T \twoheadrightarrow T'} \mathbf{H}_{\mathcal{F}}^1(K, T) &= \varprojlim_{T \twoheadrightarrow T'} \ker \left( \mathbf{H}^1(K^{\Sigma_{\mathcal{F}}}/K, T') \rightarrow \prod_{\mathfrak{u} \in \Sigma_{\mathcal{F}}} \mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T') \right) \\ &= \ker \left( \mathbf{H}^1(K^{\Sigma_{\mathcal{F}}}/K, T) \rightarrow \prod_{\mathfrak{u} \in \Sigma_{\mathcal{F}}} \varprojlim_{T \twoheadrightarrow T'} \mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T') \right) \end{aligned}$$

By the definition of propagated Selmer structure and the closedness of  $\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T)$ , we obtain that

$$\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) = \varprojlim_{T \twoheadrightarrow T'} \mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T')$$

which finish the proof of this proposition.  $\square$

The next dual proposition is proven similarly.

**Proposition 3.3.6.** ([Swe22, Proposition 2.5.6]) Let  $T$  be an ind-finite group and let  $\mathcal{F}$  be a Selmer structure defined on  $T$ . Then

$$\mathbf{H}_{\mathcal{F}}^1(K, T) = \varinjlim_{T' \hookrightarrow T} \mathbf{H}_{\mathcal{F}}^1(K, T')$$

where the limit is taken over the finite submodules  $T'$  of  $T$  and  $\mathbf{H}_{\mathcal{F}}^1(K, T')$  is the Selmer group of the propagated Selmer structure, as defined in Definition 1.2.8.

The next technical lemma shows that, in the finite case, patched Selmer groups can be obtained from patching classical Selmer groups.

**Lemma 3.3.7.** Let  $\mathcal{F} \leq \mathcal{G}$  be two Selmer structures defined on a finite Galois module  $T$ . Then there are sequences of classical Selmer structures  $(\mathcal{F}_i)$  and  $(\mathcal{G}_i)$  such that  $\mathcal{F}_i \leq \mathcal{G}_i$  for all  $i \in \mathbb{N}$  and all ultraprimes  $\mathfrak{u}$ ,

$$\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) = \mathcal{U}(H_{\mathcal{F}_i}^1(K_{\mathfrak{u}}, T)), \quad \mathbf{H}_{\mathcal{G}}^1(K_{\mathfrak{u}}, T) = \mathcal{U}(H_{\mathcal{G}_i}^1(K_{\mathfrak{u}}, T))$$

Moreover, we can construct the patched Selmer group as the ultraproduct of classical Selmer groups

$$\mathbf{H}_{\mathcal{F}}^1(K, T) = \mathcal{U}(H_{\mathcal{F}_i}^1(K, T)), \quad \mathbf{H}_{\mathcal{G}}^1(K, T) = \mathcal{U}(H_{\mathcal{G}_i}^1(K, T))$$

*Proof.* For an ultraprime  $\mathfrak{u} \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}$ , fix a representing sequence  $(\mathfrak{u}_i)$  and let  $W_{\mathfrak{u}}$  be the set of indices such that there is an isomorphism  $\varphi_i^{\mathfrak{u}} : H^1(K_{\ell_i}, T) \cong \mathbf{H}^1(K_{\mathfrak{u}}, T)$ . Note that Corollary 3.2.6 implies that  $W_{\mathfrak{u}} \in \mathcal{U}$ .

For every  $i \in \mathbb{N}$ , define the classical Selmer structure by  $\Sigma_{\mathcal{F}_i} = \{\mathfrak{u}_i : \mathfrak{u} \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}\}$  and local conditions

$$\begin{aligned} H_{\mathcal{F}_i}^1(K_{\mathfrak{u}_i}, T) &= (\varphi_i^{\mathfrak{u}})^{-1} \mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) & \text{if } i \in W_{\mathfrak{u}} \\ H_{\mathcal{F}_i}^1(K_{\mathfrak{u}_i}, T) &= 0 & \text{if } i \notin W_{\mathfrak{u}} \end{aligned}$$

This definition implies that  $\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) = \mathcal{U}(H_{\mathcal{F}_i}^1(K_{\mathfrak{u}_i}, T))$ . Therefore, Proposition 3.1.17 implies that

$$\ker \left[ \mathbf{H}^1(K^n/K, T) \rightarrow \prod_{\mathfrak{u}|n} \mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T) \right] = \ker \left[ \mathcal{U}(H^1(K^{n_i}/K, T)) \rightarrow \prod_{\mathfrak{u}_i|n_i} \mathcal{U}(H_{\mathcal{F}_i}^1(K_{\mathfrak{u}_i}, T)) \right]$$

Again by the exactness of the ultraproduct given in Proposition 3.1.17 implies that

$$\mathbf{H}_{\mathcal{F}}^1(K, T) = \mathcal{U}(H_{\mathcal{F}_i}^1(K, T))$$

Similarly, define Selmer structures  $\mathcal{G}_i$  by  $\Sigma_{\mathcal{G}_i} = \{\mathfrak{u}_i : \mathfrak{u} \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}\}$  and local conditions

$$\begin{aligned} H_{\mathcal{G}_i}^1(K_{\mathfrak{u}_i}, T) &= (\varphi_i^{\mathfrak{u}})^{-1} \mathbf{H}_{\mathcal{G}}^1(K_{\mathfrak{u}}, T) & \text{if } i \in W_{\mathfrak{u}} \\ H_{\mathcal{G}_i}^1(K_{\mathfrak{u}_i}, T) &= H^1(K_{\mathfrak{u}_i}, T) & \text{if } i \notin W_{\mathfrak{u}} \end{aligned}$$

By construction  $\mathcal{F}_i \leq \mathcal{G}_i$  and, analogously,

$$\mathbf{H}_{\mathcal{G}}^1(K, T) = \mathcal{U}(H_{\mathcal{G}_i}^1(K, T))$$

□

We can use local duality to define dual Selmer structures as in Definition 1.2.4

**Definition 3.3.8.** (Dual Selmer structure) Let  $\mathcal{F}$  be a Selmer structure on  $T$ . Then we can define a *dual Selmer structure*  $\mathcal{F}^*$  on  $T^*$  by defining the local condition  $\mathbf{H}^1(K_{\mathbf{u}}, T^*)$  as the annihilator of  $\mathbf{H}_{\mathcal{F}}^1(K_{\mathbf{u}}, T)$  under the local duality pairing in Proposition 3.2.14

Dual patched Selmer structures can be also obtained by patching the dual Selmer structures in the classical setting.

**Lemma 3.3.9.** Let  $\mathcal{F}$  a patched Selmer structure defined on a finite group  $T$  and let  $\mathcal{F}_i$  be classical Selmer structures such that

$$\mathbf{H}_{\mathcal{F}}^1(K_{\mathbf{u}}, T) = \mathcal{U}(H_{\mathcal{F}}^1(K_{\mathbf{u}}, T))$$

Then, we have that

$$\mathbf{H}_{\mathcal{F}^*}^1(K_{\mathbf{u}}, T^*) = \mathcal{U}(H_{\mathcal{F}_i^*}^1(K_{\mathbf{u}}, T^*))$$

*Proof.* By Definition 3.3.8, for every ultraprime  $\mathbf{u} = (\ell_i)$ , we have that

$$\mathbf{H}_{\mathcal{F}^*}^1(K_{\mathbf{u}}, T^*) = \ker \left( H^1(K_{\mathbf{u}}, T^*) \rightarrow \text{Hom} \left( H_{\mathcal{F}}^1(K_{\mathbf{u}}, T) \rightarrow \frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}} \right) \right)$$

where the map is induced by local duality, as stated in Proposition 3.2.14. This map can be also written as the composite

$$\begin{aligned} \mathcal{U}(H^1(K_{\ell_i}, T^*)) &\rightarrow \mathcal{U} \left( \text{Hom} \left( H_{\mathcal{F}_i}^1(K_{\ell_i}, T), \frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}} \right) \right) \\ &\hookrightarrow \text{Hom} \left( \mathcal{U}(H_{\mathcal{F}_i}^1(K_{\ell_i}, T)), \mathcal{U} \left( \frac{(\#T)^{-1}\mathbb{Z}}{\mathbb{Z}} \right) \right) \end{aligned}$$

where the second map is the injection given in Proposition 3.1.14. By Proposition 1.1.17 and 3.1.17, we can compute the kernel of this map as

$$\mathbf{H}_{\mathcal{F}^*}^1(K_{\mathbf{u}}, T^*) = \mathcal{U}(H_{\mathcal{F}_i^*}^1(K_{\ell_i}, T^*))$$

□

There is also a global duality exact sequence in this setting.

**Proposition 3.3.10.** (Global duality) Let  $\mathcal{F} \leq \mathcal{G}$  be two Selmer structures. Then there is a global duality exact sequence

$$H_{\mathcal{F}}^1(K, T) \twoheadrightarrow H_{\mathcal{G}}^1(K, T) \longrightarrow \bigoplus_{\ell \in \Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}} \frac{H_{\mathcal{G}}^1(K_{\ell}, T)}{H_{\mathcal{F}}^1(K_{\ell}, T)} \longrightarrow H_{\mathcal{G}^*}^1(K, T^*)^{\vee} \twoheadrightarrow H_{\mathcal{F}^*}^1(K, T^*)^{\vee}$$

*Proof.* Assume first that  $T$  is finite. Let  $\mathbf{n} = (n_k)_{k \in \mathbb{N}}$  be the square-free product of all ultraprimes in  $\Sigma_{\mathcal{F}} \cup \Sigma_{\mathcal{G}}$ . By Lemma 3.3.7, there are sequences of classical Selmer structures  $(\mathcal{F}_i)$  and  $(\mathcal{G}_i)$ , where  $\mathcal{F}_i \leq \mathcal{G}_i$ , and

$$\mathbf{H}_{\mathcal{F}}^1(K_{\mathbf{u}}, T) = \mathcal{U}(H_{\mathcal{F}_i}^1(K_{\mathbf{u}_i}, T)), \quad \mathbf{H}_{\mathcal{G}}^1(K_{\mathbf{u}}, T) = \mathcal{U}(H_{\mathcal{G}_i}^1(K_{\mathbf{u}_i}, T))$$

By the exactness of the ultraproduct shown in Proposition 3.1.17, the Selmer groups of  $\mathcal{F}$  and  $\mathcal{G}$  are also ultraproducts of classical Selmer groups:

$$\mathbf{H}_{\mathcal{F}}^1(K, T) = \mathcal{U}(H_{\mathcal{F}_i}^1(K, T)), \quad \mathbf{H}_{\mathcal{G}}^1(K_{\mathbf{u}}, T) = \mathcal{U}(H_{\mathcal{G}}^1(K, T))$$

By Lemma 3.3.9 and Proposition 3.1.17, the dual Selmer groups can be also obtained as an ultraproduct of classical Selmer groups:

$$\mathbf{H}_{\mathcal{F}^*}^1(K, T^*) = \mathcal{U}(H_{\mathcal{F}_i^*}^1(K, T^*)), \quad \mathbf{H}_{\mathcal{G}^*}^1(K_{\mathbf{u}}, T^*) = \mathcal{U}(H_{\mathcal{G}^*}^1(K, T^*))$$

Then the global duality exact sequence is

$$\mathcal{U}(H_{\mathcal{F}_i}^1(K, T)) \hookrightarrow \mathcal{U}(H_{\mathcal{G}}^1(K, T)) \longrightarrow \mathcal{U}\left(\bigoplus_{\ell} \frac{H_{\mathcal{G}}^1(K_{\ell}, T)}{H_{\mathcal{F}}^1(K_{\ell}, T)}\right) \longrightarrow \mathcal{U}(H_{\mathcal{G}^*}^1(K, T^*)^{\vee}) \twoheadrightarrow \mathcal{U}(H_{\mathcal{F}^*}^1(K, T^*)^{\vee})$$

which is exact by Proposition 3.1.17.

profinite or ind-finite

□

### 3.3.2 Patched Selmer modules

In this section, we endow the group  $T$  with an module structure and will try to reprove the results in §1.2

**Notation 3.3.11.** Let  $R$  be a complete, local ring with finite residue field  $k$  and let  $T$  be an  $R[[G_K]]$ -module that is free and finitely generated as an  $R$ -module.

**Proposition 3.3.12.** Under Assumptions 3.2.11, for every finitely generated ideal  $I$  of  $R$ , the inclusion  $T^*[I] \hookrightarrow T^*$  induces an isomorphism

$$H_{\mathcal{F}^*}^1(K, T^*[I]) \cong H_{\mathcal{F}}^1(K, T^*)[I]$$

*Proof.* Hence, Proposition long exact sequence induces an injection

$$H^1(K^{\mathbf{n}_i}/K, T^*[I]) \hookrightarrow H^1(K^{\mathbf{n}_i}/K, T^*)[I]$$

By Definition 3.3.1, there is an injection

$$H_{\mathcal{F}}^1(K, T^*[I]) \hookrightarrow H_{\mathcal{F}}^1(K, T^*)[I]$$

Let  $\mathbf{n}$  be the square-free product of all primes in  $\Sigma_{\mathcal{F}}$ . By (T1) in Assumption 3.2.11, we have that need to redo with quotients of  $T^*$

$$\mathbf{H}^0(K^{\mathbf{n}}, T^*) = H^0(K, T^*) = 0$$

Consider the exact sequence

$$0 \longrightarrow T^*[I] \longrightarrow T^* \longrightarrow T^*/T^*[I]$$

By Propostion **long exact sequence**, it induces an exact sequence

$$0 \longrightarrow \mathbf{H}^1(K^n/K, T^*[I]) \longrightarrow \mathbf{H}^1(K^n/K, T^*) \longrightarrow \mathbf{H}^1(K^n/K, T^*/T^*[I]) \longrightarrow 0 \quad (3.1)$$

Let  $\{r_1, \dots, r_d\}$  be a minimal set of generators of  $I$ . It induces an injection

$$T^*/T^*[I] \hookrightarrow (T^*)^d, \quad t \mapsto (r_1 t, \dots, r_d t)$$

By **cite**  $H^0 = 0$ , it induces an injection

$$\mathbf{H}^1(K^n/K, T^*/T^*[I]) \hookrightarrow \mathbf{H}^1(K^n/K, T^*)^d$$

**complete** Since the composition

$$\mathbf{H}^1(K^n/K, T^*) \rightarrow \mathbf{H}^1(K^n/K, T^*/T^*[I]) \hookrightarrow \mathbf{H}^1(K^n/K, T^*)^d$$

is the multiplication by  $(r_1, \dots, r_d)$ , its kernel coincides with  $\mathbf{H}^1(K^n/K, T^*)[I]$ . Since the second map is injective, the kernel coincides with the kernel of the first map. From (3.1), we can conclude that

$$\mathbf{H}^1(K^n/K, T^*[I]) = \mathbf{H}^1(K^n/K, T^*)[I]$$

Consider the following commutative diagram with exact rows

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathbf{H}_{\mathcal{F}}^1(K, T^*[I]) & \longrightarrow & \mathbf{H}^1(K^n/K, T^*[I]) & \longrightarrow & \bigoplus_{u \in \Sigma_{\mathcal{F}}^*} \mathbf{H}_{/\mathcal{F}^*}^1(K_u, T^*[I]) \\ & & \downarrow & & \downarrow \sim & & \downarrow \\ 0 & \longrightarrow & \mathbf{H}_{\mathcal{F}}^1(K, T^*)[I] & \longrightarrow & \mathbf{H}^1(K^n/K, T^*)[I] & \longrightarrow & \bigoplus_{u \in \Sigma_{\mathcal{F}}^*} \mathbf{H}_{/\mathcal{F}^*}^1(K_u, T^*)[I] \end{array}$$

We have already seen that the middle vertical arrow is an isomorphism. The right vertical arrow is injective, since its dual  $\mathbf{H}_{\mathcal{F}}^1(K_u, T) \twoheadrightarrow \mathbf{H}_{\mathcal{F}}^1(K_u, T/I)$  is surjective by definition of propagated Selmer structures. Therefore, the leftmost vertical arrow is also an isomorphism.  $\square$

### 3.3.3 Suitable ultraprimes

This section is devoted to prove analogues of Propositions 1.2.21 and 1.2.27

### 3.3.4 Patched Selmer modules over discrete valuation rings

**Notation 3.3.13.** Let  $R$  be a discrete valuation ring and let  $T$  be an  $R[[G_K]]$ -module that is free and finitely generated as an  $R$ -module.

**Remark 3.3.14.** Note that we can compute the patched cohomology groups as the limits

$$\mathbf{H}^1(G, T) = \varprojlim_n \mathbf{H}^1(G, T/\mathfrak{m}^i T), \quad \mathbf{H}^1(G, T) = \varinjlim_n \mathbf{H}^1(G, T[\mathfrak{m}^i])$$

since  $T/\mathfrak{m}^i T$  (resp.  $T^*[\mathfrak{m}^i]$ ) is a cofinal sequence in the finite quotients of  $T$  (resp. finite submodules of  $T^*$ ).

We will be interested in studying local conditions that are cartesian.

**Definition 3.3.15.** (Cartesian local condition) A local condition  $\mathbf{H}_{\mathcal{F}}^1(K_u, T) \subset \mathbf{H}^1(K_u, T)$  is called *cartesian* if  $H_{\mathcal{F}}^1(K_u, T)$  is a torsion-free  $R$ -module. A Selmer structure is said to be cartesian if all of its local conditions are cartesian.

**Remark 3.3.16.** By [MR04, Lemma 3.7.1], if a Selmer structure on  $T$  is cartesian as in Definition 3.3.15, the propagated Selmer structure to a finite quotient  $T/\mathfrak{m}^i$  will be cartesian in the sense of Definition 1.2.11.

### finite cohomology

When a Selmer structure is cartesian, the propagated Selmer group of quotients of  $T$  can be described as a quotient of the Selmer group of  $T$ .

**Proposition 3.3.17.** Let  $\mathcal{F}$  be a cartesian Selmer structure. For  $k \in \mathcal{N}$ , there is an injection with finite cokernel  $C$

$$\mathbf{H}_{\mathcal{F}}^1(K, T)/\mathfrak{m}^k \hookrightarrow \mathbf{H}_{\mathcal{F}}^1(K, T/\mathfrak{m}^k)$$

*Proof.* Let  $\pi$  be a generator of  $\mathfrak{m}$ . Consider the exact sequence

$$0 \longrightarrow T \xrightarrow{\pi^k} T \longrightarrow T/\mathfrak{m}^k$$

It induces an injection

$$\mathbf{H}^1(K, T)/\mathfrak{m}^k \hookrightarrow \mathbf{H}^1(K, T/\mathfrak{m}^k)$$

By the definition of Selmer group, there is an injection

$$\frac{\mathbf{H}^1(K, T)}{\mathbf{H}_{\mathcal{F}}^1(K, T)} \rightarrow \prod_{\mathcal{U}(\mathbb{P})} \frac{\mathbf{H}^1(K_u, T)}{\mathbf{H}_{\mathcal{F}}^1(K_u, T)}$$

Since the Selmer structure is cartesian, the product is torsion-free, so the domain is torsion free as well. By the snake's lemma, it implies that the top vertical map in the following diagram is injective.

$$\begin{array}{ccc} \mathbf{H}_{\mathcal{F}}^1(K, T)/\mathfrak{m}^k & \longrightarrow & \mathbf{H}_{\mathcal{F}}^1(K, T/\mathfrak{m}^k) \\ \downarrow & & \downarrow \\ \mathbf{H}^1(K, T)/\mathfrak{m}^k & \longrightarrow & \mathbf{H}^1(K, T/\mathfrak{m}^k) \end{array}$$

Hence the top horizontal map is also injective. Snake's lemma shows that

$$\text{length}(C) \leq \text{length} \mathbf{H}^2(K, T[\mathfrak{m}^k])$$

explain further, long exact sequence of patched cohomology, Mazur Rubin 3.7.1

□

We now prove an analogue of Proposition 1.2.16 for patched Selmer structures. Recall that core rank was defined in the classical setting in Definition 1.2.14 and it is defined in the same way in this patched setting.

**Proposition 3.3.18.** Let  $\mathcal{F}$  be a cartesian Selmer structure on  $T$  of core rank  $\chi(\mathcal{F})$ . For every  $k \geq 0$ , there is a non-canonical isomorphism

$$\mathbf{H}_{\mathcal{F}}^1(K, T/\mathfrak{m}^k) \cong \left(R/\mathfrak{m}^k\right)^{\chi(\mathcal{F})} \oplus \mathbf{H}_{\mathcal{F}^*}^1(K, T^*[\mathfrak{m}^k])$$

*Proof.* write □

assumptions on  $H^0$

**Proposition 3.3.19.** Let  $\mathcal{F}$  be a cartesian Selmer structure on  $T$  of core rank  $\chi(\mathcal{F})$ . Then

$$\text{rank}_R \mathbf{H}^1(K, T) - \text{rank}_R \mathbf{H}^1(K, T^*)^\vee = \chi(\mathcal{F})$$

*Proof.* For every  $k \geq 0$ , there is an isomorphism proof needed

$$\mathbf{H}_{\mathcal{F}}^1(K, T^*[\mathfrak{m}^k]) \cong \mathbf{H}^1(K, T^*)[\mathfrak{m}^k]$$

Therefore,  $\mathbf{H}^1(K, T^*)$  is cofinitely generated, so there are constants  $a$  and  $b$  such that

$$\text{length}(\mathbf{H}_{\mathcal{F}}^1(K, T^*[\mathfrak{m}^k])) = ak + b$$

By Proposition 3.3.18, then

$$\text{length}(\text{rank}_R \mathbf{H}^1(K, T/\mathfrak{m}^k)) = (a + \chi(\mathcal{F}))k + b$$

By Proposition 3.3.17, there is a constant  $f$  such that

$$(a + \chi(\mathcal{F}))k + b - f \leq \text{length}(\text{rank}_R \mathbf{H}^1(K, T)/\mathfrak{m}^k) \leq (a + \chi(\mathcal{F}))k + b$$

Hence  $\mathbf{H}^1(K, T)$  is also finitely generated of rank  $a + \chi(\mathcal{F})$ . □

Under assumptions 1.1.5, the profinite Selmer groups are free modules.

**Proposition 3.3.20.** Assume  $T$  satisfies Assumption 1.1.5 and  $\mathcal{F}$  is any Selmer structure. Then  $H_{\mathcal{F}}^1(K, T)$  is a free  $R$ -module. Moreover, if  $\mathcal{F}$  is a cartesian, then the quotient

$$\frac{\mathbf{H}^1(K, T)}{\mathbf{H}_{\mathcal{F}}^1(K, T)}$$

is torsion free.

*Proof.* Consider the exact sequence

$$0 \longrightarrow T \longrightarrow T \longrightarrow T/\mathfrak{m} \longrightarrow 0$$

Then (T1) implies that  $H^0(K, T/\mathfrak{m})$ , so  $\mathbf{H}^1(K, T)$  contains no torsion. By the definition of Selmer module, there is an injection

$$\frac{\mathbf{H}^1(K, T)}{\mathbf{H}_{\mathcal{F}}^1(K, T)} \hookrightarrow \bigoplus_{\mathfrak{u} \in \mathcal{U}(\mathcal{P})} \frac{\mathbf{H}^1(K_{\mathfrak{u}}, T)}{\mathbf{H}_{\mathcal{F}}^1(K_{\mathfrak{u}}, T)}$$

Since  $\mathcal{F}$  is cartesian, the latter is torsion-free, which implies that the domain is also torsion-free. □

### 3.4 Ultra Kolyvagin systems

**Definition 3.4.1.** An *ultra Kolyvagin system* for a Selmer structure  $\mathcal{F}$

$$\kappa = \left\{ \kappa_n \in H_{\mathcal{F}(n)}^1(\mathbb{Q}, T) : n \in \mathcal{N} \right\}$$

satisfying the following relation for every  $n \in \mathcal{N}$  and  $\ell \in \mathcal{P}$  not dividing  $n$ . By the definition of Selmer module, we have that

$$\text{loc}_\ell(\kappa_n) \in H_{\mathcal{F}(n)}^1(K_\ell, T) = H_{\mathbf{f}}^1(K_\ell, T), \quad \text{loc}_\ell(\kappa_{n\ell}) \in H_{\mathcal{F}(n\ell)}^1(K_\ell, T) = H_{\mathbf{tr}}^1(K_\ell, T)$$

The collection  $\kappa$  is a Kolyvagin system if the following is satisfied

$$\text{loc}_\ell(\kappa_{n\ell}) = \phi_\ell^{\text{fs}} \circ \text{loc}_\ell(\kappa_n)$$

for every  $n \in \mathcal{N}$  and  $\ell \in \mathcal{P}$  not dividing  $n$ .

## Chapter 4

# Kolyvagin systems over the Iwasawa algebra

The results in previous chapters were limited to principal rings. Here, we generalise previous results to compute the Fitting ideal over the Iwasawa algebra  $\Lambda := \mathbb{Z}_p[[T]]$ . For that we need to consider Kolyvagin systems consisting of collections of classes in exterior biduals of Selmer groups, as defined in [BSS18]. In this chapter, we combine this setting with the patched Selmer groups defined in Chapter 3 following [Swe22]. This new setting presents some technical complications, since the coefficient ring  $\Lambda$  is no longer self-injective, a condition required in the construction in [BSS18].

### 4.1 Iwasawa Selmer modules

In this chapter, we will assume that we are working with a Galois representation  $\mathbf{T}$  over the Iwasawa algebra.

**Assumption 4.1.1.** Let  $\Lambda = \mathbb{Z}_p[[X]]$  be the classical Iwasawa algebra and let  $\mathbf{T}$  be a  $\Lambda[[G_K]]$ -module that is free and finitely generated as a  $\Lambda$ -module.

We will aim to develop a theory of Kolyvagin systems to study Selmer groups defined on  $\mathbf{T}$ . We will use the patched cohomology setting, as in Definition 3.3.1.

The definition of patched Selmer structures for these Galois representations is included in Definition 3.3.1. But the definition of patched cartesian Selmer structures, established in Definition 3.3.15, was exclusive for discrete valuation rings. However, a similar definition applies to Iwasawa Selmer modules.

**Definition 4.1.2.** (Cartesian local condition) A local condition  $\mathbf{H}_{\mathcal{F}}^1(K_u, T) \subset \mathbf{H}^1(K_u, T)$  is called *cartesian* if  $H_{\mathcal{F}}^1(K_u, T)$  is a torsion-free  $R$ -module. A Selmer structure is said to be cartesian if all of its local conditions are cartesian.

#### 4.1.1 Suitable ultraprimes

This section is devoted to proving analogues of Propositions 1.2.21 and 1.2.27 in the setting of patched Iwasawa Selmer groups.

**Proposition 4.1.3.** Assume  $R$  is a zero-dimensional Gorenstein ring and  $T$  is an  $R[[G_K]]$ -module. Let  $c_1, \dots, c_s \in H^1(K, T)$  and let  $c_1^*, \dots, c_t^* \in H^1(K, T^*)$ . Assume that  $s + t \leq p$ . Let  $x_i \in \text{Ann}(\text{Ann}(c_i))$  and  $x_i^* \in \text{Ann}(\text{Ann}(c_i^*))$  be non-zero elements.

Then there exists a set  $\mathcal{Q} \subset \mathcal{P}$  such that for all  $q \in \mathcal{Q}$ , the localizations  $x_i \in R\text{loc}_q(c_i)$  and  $y_i \in R\text{loc}_q(c_i^*)$  for all  $i \leq s$  and  $j \leq t$ .

*Proof.* By [BSS18, Lemma 3.9], the restriction induces an injection

$$H^1(K, T) \hookrightarrow \text{Hom}(K(T)_M, T/(\tau - 1)T)$$

Let  $F_i$  be the field of definition of  $c_i$ , let  $\tilde{c}_i : G_K \rightarrow T$  be a cocycle representing  $c_i$ , and define  $a_i := -\tilde{c}_i(\tau) \in T/(\tau - 1)T$ . The definition of  $a_i$  is independent of the choice of the cocycle, which implies that  $a_i \in T/(\tau - 1)T[\text{Ann}(c_i)]$ .

The image of  $f(c_i)$  coincides with  $(T/(\tau - 1)T)[\text{Ann}(c_i)]$ . Indeed, the injectivity of  $f$  implies that  $\text{Ann}(f(c_i)) = \text{Ann}(c_i)$  and, since  $R$  is self-injective and  $R \cong T/(\tau - 1)T$ ,  $\text{Im}(c_i) = \text{Ann}(\text{Ann}(c_i))$ .

Define

$$H_i = f(c_i)^{-1}(a_i + \mathfrak{m}\text{Im}(c_i)) \subset G_{K(T)_M}$$

which is a coset of the subgroup  $f(c_i)^{-1}(\mathfrak{m}\text{Im}(c_i))$ . By Nakayama's lemma and the assumption on the principality of  $\text{Im}(c_i) = \text{Ann}(\text{Ann}(c_i))$ , the index of this subgroup is  $p$ .

Similarly, define  $F_j^*$ ,  $a_j^*$  and  $H_j^*$  similarly for the class  $c_j^*$ .

By the assumption  $s + t < p$ , we can find

$$\gamma \in G_{K(T)_M} \setminus (H_1 \cup \dots \cup H_s \cup H_1^* \cup \dots \cup H_t^*)$$

Set  $F = K(T)_M F_1 \dots F_s F_1^* \dots F_t^*$ , and define  $\mathcal{Q}$  be the set of primes  $q \notin S$  such that  $q$  is unramified in  $F/K$  and  $\text{Frob}_q$  is conjugate to  $\tau\gamma$  in  $\text{Gal}(F/K)$ . Then Chebotarev density theorem implies that  $\mathcal{Q}$  has positive density, and it is contained in  $\mathcal{P}$  by construction. For every  $q \in \mathcal{Q}$ , we have that

$$\text{loc}_q(c_i) = c_i(\tau\gamma) = \tau c_i(\gamma) + c_i(\tau) = f(c_i)(\gamma) - a_i \in \text{Im}(f(c_i)) \setminus \mathfrak{m}\text{Im}(f(c_i)) \subset T/(\tau - 1)T$$

under the identification  $H_f^1(K_q, T) \cong T/(\text{Frob}_q - 1)T = T/(\tau - 1)T$ . Since  $\text{Im}(c_i)$  is principal, Nakayama's lemma implies that it is generated by  $\text{loc}_q(c_i)$ . An analogous argument works for  $\text{loc}_q(c_i^*)$ .  $\square$

**Proposition 4.1.4.** Let  $c \in \mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, T)$  be an element such that its projection to  $\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, T/(p^n, X^m)T)$  is nonzero. Then there exists a Kolyvagin ultraprime  $\mathfrak{u}$  such that

$$(p^{n-1}X^{m-1})\mathbf{H}^1(\mathbb{Q}_{\mathfrak{u}}, T) \subset \text{loc}_{\mathfrak{u}}(\Lambda c)$$

*Proof.* Write  $c_{a,b}$  to the projection of  $c$  to  $\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, T/(p^a, t^b)T)$ .

Note that, since  $c_{n,m} \neq 0$ , then  $p^r T^s c_{n+r, m+s} \neq 0$ . **prove this**

For every  $(n+r, m+s) \in \mathbb{N}^2$ , let  $\ell_{n,m}$  be a Kolyagin prime for  $T_{n,m}$  such that  $\text{loc}_{\ell_{n+r, m+s}}(p^r T^s c_{n+r, m+s}) \neq 0$ . Use an ordering of  $\mathbb{N}^2$  to construct an ultraprime  $\mathbf{u}$  as the sequence of all the  $n, m$ .

It is easily seen that  $\text{loc}$  □

**Assumption 4.1.5.** Let  $I = f\Lambda$  be a principal ideal. The canonical map

$$\mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T})/I\mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}) \rightarrow \mathbf{H}_{\mathcal{F}}^1(K, T/IT)$$

is an injection.

**Assumption 4.1.6.** If  $\mathbf{T}'$  is a quotient of  $\mathbf{T}$ , then  $H^0(K, \mathbf{T}') = 0$ .

**Lemma 4.1.7.** Assume that  $\mathbf{H}^1(\mathbb{Q}, \mathbf{T})$  is non-zero and that there is a map

$$\varphi : \Lambda \rightarrow \mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*)^\vee$$

with kernel  $f\Lambda$ , where  $f$  is either 0 or a product of a distinguished polynomial with a power of  $p$ . Then there exists a Kolyagin ultraprime  $\mathbf{u}$  such that

$$\text{loc}_{\mathbf{u}} : \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}) \rightarrow \mathbf{H}_{\mathbf{f}}^1(K_{\mathbf{u}}, \mathbf{T})$$

is surjective and

$$\text{loc}_{\mathbf{u}}^* : \mathbf{H}_{\mathbf{f}}^1(K_{\mathbf{u}}, \mathbf{T}^*)^\vee \rightarrow \mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee$$

has kernel contained in  $f\mathbf{H}_{\mathbf{f}}^1(K_{\mathbf{u}}, \mathbf{T}^*)^\vee$ .

*Proof.* By Nakayama's lemma, there exists  $\alpha \in \mathbf{H}^1(\mathbb{Q}, \mathbf{T}) \setminus \mathfrak{m}\mathbf{H}^1(\mathbb{Q}, \mathbf{T})$ . Write

$$\alpha = (\alpha_{n,m}) \in \varprojlim_{n,m} \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}_{n,m}) = \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}_{n,m})$$

Since  $\alpha \notin p\mathbf{H}^1(K, \mathbf{T})$ , assumption 4.1.5 implies that  $\alpha$  projects to a non-zero element in  $\mathbf{H}^1(\mathbb{Q}, \mathbf{T}/p\mathbf{T})$ . Since  $\Lambda/p\Lambda \cong \mathbb{F}_p[[X]]$  is a discrete valuation ring, then

$$\mathbf{H}^1(\mathbb{Q}, \mathbf{T}/p\mathbf{T}) = \varprojlim_m \mathbf{H}^1(\mathbb{Q}, \mathbf{T}_{1,m})$$

Therefore, there exists some  $m_0$  such that  $\alpha_{1,m_0} \neq 0$ . It implies that  $\alpha_{n,m} \neq 0$  for all  $m \geq m_0$ . Moreover, the composition of maps

$$\mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}_{n,m}) \longrightarrow \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}_{1,m_0}) \xrightarrow{p^{n-1}X^{m-m_0}} \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}_{n,m})$$

is the multiplication by  $p^{n-1}X^{m-m_0}$ . Since  $\alpha_{1,m_0}$  is the image of  $\alpha_{n,m}$  under the first map and the second map is injective by assumption 4.1.6, we get that  $p^{n-1}X^{m-m_0}\alpha_{n,m} \neq 0$ .

Similarly, since  $\alpha \notin X\mathbf{H}^1(\mathbb{Q}, T)$ , an analogous argument swapping the roles of  $p$  and  $X$  implies that  $\alpha_{n_0,1} \neq 0$ . From this, it follows that  $p^{n-n_0}X^{m-1}\alpha_{n,m} \neq 0$  for all  $n \geq n_0$ .

On the dual side, the map  $\varphi$  induces a surjective map in the dual spaces:

$$\varphi^* : \mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*) \rightarrow \Lambda^\vee[f^*]$$

where  $f^*$  is the dual polynomial of  $f$ , i.e., the image of  $f$  under the  $\Lambda$  automorphism that sends  $(1+X)$  to  $(1+X)^{-1}$ . We need to consider the cases where  $f = 0$  and  $f \neq 0$  separately.

$f=0$

When  $f \neq 0$ , we can express it as  $f = p^\alpha g$ , for some non-negative integer  $\alpha$  and some distinguished polynomial  $g$  of degree  $d$ . Since  $\Lambda$  is a unique factorisation domain, there is an injective homomorphism

$$\Lambda/(f) \hookrightarrow \Lambda/(p^\alpha) \times \Lambda/(g)$$

It induces a surjection on the Pontryagin duals

$$\Lambda^\vee[p^\alpha] \times \Lambda^\vee[g^*] \twoheadrightarrow \Lambda^\vee[f^*]$$

Note that this map is induced by the canonical inclusion at every factor.

For every  $n \in \mathbb{N}$ , the module  $\Lambda^\vee[g^*, p^n]$  is the Pontryagin dual of  $\Lambda/(g, p^n)$ , so it is a free  $\mathbb{Z}/p^n$  module of rank  $d$ . Since

$$\dim_{\Lambda/\mathfrak{m}} \Lambda^\vee[g^*, p^n]/\mathfrak{m} = \dim_{\Lambda/\mathfrak{m}} \Lambda/(g, p^n)[\mathfrak{m}] = 1,$$

then  $\Lambda^\vee[g^*, p^n]$  is a cyclic  $\Lambda$ -module. Note that, if  $x_n$  is a generator of  $\Lambda^\vee[g^*, p^n]$ , then  $p^{n-1}X^{d-1}x_n$  is a non-trivial element in  $\Lambda^\vee[\mathfrak{m}]$ .

Since the map  $\varphi^*$  is surjective, there exists some element  $\gamma_n \in \mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*)$  such that  $\varphi^*(\gamma_n) = x_n$ . Since

$$\varphi^*(p^{n-1}X^{d-1}\gamma_n) = p^{n-1}X^{d-1}x_n \neq 0$$

Therefore,  $p^{n-1}X^{d-1}\gamma_n \neq 0$ .

When  $\alpha \geq 1$ , for every  $n \in \mathbb{N}$ , the module  $\Lambda^\vee[p^\alpha, X^n]$  is the dual of  $\Lambda/(p^\alpha, X^n)$ . Since the  $\mathfrak{m}$ -torsion of  $\Lambda/(p^\alpha, X_m)$  is a one-dimensional  $\Lambda/\mathfrak{m}$ -vector space, then  $\Lambda^\vee[p^\alpha, X^n]$  is a cyclic  $\Lambda$ -module. Let  $y_n$  be a generator of  $\Lambda^\vee[p^\alpha, X^n]$ . Since  $\varphi^*$  is a surjective map and  $y_n \in \Lambda[f^*]$ , there is some element  $\beta_n \in \mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*)$  such that  $\varphi^*(\beta_n) = y_n$ . Since  $\varphi^*(p^{\alpha-1}X^{n-1}\beta_n) \neq 0$ , then  $p^{\alpha-1}X^{n-1}\beta_n \neq 0$  as well.

Since

$$\mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*) = \varinjlim_{n,m} \mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, (\mathbf{T}_{n,m})^*)$$

there is a pair  $(r(n), s(n))$  for every  $n \in \mathbb{N}$  such that both

$$\beta_n, \gamma_n \in \text{Im}\left(\mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, (\mathbf{T}_{r(n), s(n)})^*) \hookrightarrow \mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*)\right)$$

When there is no risk of confusion, we will denote the preimages of  $\beta_n$  and  $\gamma_n$  indistinctly. We can assume without loss of generality that  $r(n), s(n) \geq n, \alpha, n_0, m_0$ .

For any  $n \in \mathbb{N}$ , fix a representative  $(c_{r(n), s(n)}^{(i)})_{i \in \mathbb{N}}$  of  $c_{r(n), s(n)}$  in the patched cohomology group  $\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, \mathbf{T}_{r(n), s(n)})$ . Since  $p^{r(n)-1}X^{s(n)-m_0}c_{r(n), s(n)} \neq 0$  and  $p^{r(n)-n_0}X^{s(n)-1}c_{r(n), s(n)} \neq 0$ , we can guarantee that  $p^{r(n)-1}X^{s(n)-m_0}c_{r(n), s(n)}^{(i)} \neq 0$  and  $p^{r(n)-n_0}X^{s(n)-1}c_{r(n), s(n)}^{(i)} \neq 0$  for  $\mathcal{U}$ -many  $i$ .

Similarly, we can find representatives  $\beta_n^{(i)}$  and  $\gamma_n^{(i)}$  of  $\beta_n$  and  $\gamma_n$ , respectively, in  $\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, (\mathbf{T}_{r(n),s(n)})^*)$ . Similarly,  $p^{\alpha-1}X^{n-1}\beta_n^{(i)} \neq 0$  and  $\lambda_n\gamma_n^{(i)} \neq 0$  for  $\mathcal{U}$ -many  $i$ .

Since the ultrafilter is closed by finite intersections, the set  $S$  of indices  $i$  such that all of the conditions

$$\begin{aligned} p^{r(n)-1}X^{s(n)-m_0}c_{r(n),s(n)}^{(i)} &\neq 0, & p^{r(n)-n_0}X^{s(n)-1}c_{r(n),s(n)}^{(i)} &\neq 0, \\ p^{\alpha-1}X^{n-1}\beta_n^{(i)} &\neq 0, & p^{n-1}X^{d-1}\gamma_n^{(i)} &\neq 0 \end{aligned}$$

hold is in the ultrafilter. In particular,  $S$  is infinite, so there is a unique increasing bijection  $\iota : \mathbb{N} \rightarrow S$ .

Note that  $c_{r(n),s(n)}^{(i)}$  and  $c_{r(n),s(n)}^{(i)}$  belong to  $H^1(K, \mathbf{T}_{r(n),s(n)})$ , and  $\beta_n^{(i)}$  and  $\gamma_n^{(i)}$  belong to  $H^1(K, (\mathbf{T}_{r(n),s(n)})^*)$ . By [MR04, proposition 3.6.1] (see also [BSS18]), for all  $n$  there exists a Kolyvagin prime  $\ell_n$  for the representation  $\mathbf{T}_{r(n),s(n)}$  such that the localization maps

$$\begin{aligned} \text{loc}_{\ell_n} : H^1(K, \mathbf{T}_{r(n),s(n)}) &\rightarrow H^1(K_{\ell_n}, \mathbf{T}_{r(n),s(n)}) \\ \text{loc}_{\ell_n}^* : H^1(K, (\mathbf{T}_{r(n),s(n)})^*) &\rightarrow H^1(K_{\ell_n}, (\mathbf{T}_{r(n),s(n)})^*) \end{aligned}$$

satisfy that

$$\begin{aligned} \text{loc}_{\ell_n}(p^{r(n)-1}X^{s(n)-m_0}c_{r(n),s(n)}^{\iota(n)}) &\neq 0, & \text{loc}_{\ell_n}(p^{r(n)-n_0}X^{s(n)-1}c_{r(n),s(n)}^{(i)}) &\neq 0, \\ \text{loc}_{\ell_n}(p^{\alpha-1}X^{n-1}\beta_n^{\iota(n)}) &\neq 0, & \text{loc}_{\ell_n}(p^{n-1}X^{d-1}\gamma_n^{\iota(n)}) &\neq 0 \end{aligned}$$

The image  $\text{loc}_{\ell_n}(c_{r(n),s(n)}^{\iota(n)})$  belongs to  $H_{\mathbf{f}}^1(K_{\ell_n}, \mathbf{T}_{r(n),s(n)})$ , which is isomorphic to the quotient  $\Lambda/(p^{r(n)}, X^{s(n)})$  since  $\ell_n$  is a Kolyvagin prime. By the assumptions on the prime  $\ell_n$ ,  $\text{loc}_{\ell_n}(c_{r(n),s(n)})^{\iota(n)}$  is not  $p^{r(n)-1}$  torsion nor  $X^{s(n)-1}$  torsion. Therefore,  $\text{loc}_{\ell_n}(c_{r(n),s(n)})^{\iota(n)}$  generates the whole  $H^1(K_{\ell_n}, \mathbf{T}_{r(n),s(n)})$ .

On the dual side,  $\text{loc}_{\ell_n}(\beta_n)$  and  $\text{loc}_{\ell_n}(\gamma_n)$  belong to  $H_{\mathbf{f}}^1(K_{\ell_n}, (\mathbf{T}_{r(n),s(n)})^*)$ , which is isomorphic to  $\Lambda^{\vee}[p^{\alpha}, X^n]$ . Since  $p^{\alpha-1}X^{n-1}\text{loc}_{\ell_n}(\beta_n) \neq 0$ , then

$$\Lambda \text{loc}_{\ell_n}(\beta_n) \supset H^1(K_{\ell_n}, (\mathbf{T}_{r(n),s(n)})^*)[p^{\alpha}, X^{n-1}]$$

Similarly,  $\lambda_n \text{loc}_{\ell_n}(\gamma_n) \neq 0$ . Since  $\Lambda/(p^{r(n)}, X^{s(n)})$  is a Gorenstein ring, we can find some  $z_n \in \Lambda$  such that  $z_n \lambda_n \text{loc}_{\ell_n}(\gamma_n) \neq 0$  is a non-trivial  $\mathfrak{m}$ -torsion element. Consider the element  $z_n \text{loc}_{\ell_n}(\gamma_n)$ . Its annihilator contains  $\lambda_n \cdot \mathfrak{m}$  but does not contain  $\lambda_n$ .

Construct the ultraprime  $\mathfrak{u}$  as the equivalence class of the sequence  $(\ell_n)$ . Then, the image of  $\text{loc}_{\mathfrak{u}}$  contains  $\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}_{\mathfrak{u}}, \mathbf{T}^*)[f^*]$ . This implies that there is a surjection

$$\text{loc}_{\mathfrak{u}}(\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, \mathbf{T}^*)^{\vee}) \twoheadrightarrow \mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}_{\mathfrak{u}}, \mathbf{T}^*)^{\vee}/(f)$$

Since  $\text{loc}_{\mathfrak{u}}^{\vee}$  factors through

$$\mathbf{H}_{\mathcal{S}}^1(\mathbb{Q}_{\mathfrak{u}}, \mathbf{T}^*)^{\vee} \twoheadrightarrow \text{loc}_{\mathfrak{u}}(\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, \mathbf{T}^*))^{\vee} \hookrightarrow \mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, \mathbf{T}^*)^{\vee}$$

then  $\ker(\text{loc}_{\mathfrak{u}})$  is contained in  $f\mathbf{H}_{\mathcal{S}}^1(\mathbb{Q}_{\mathfrak{u}}, \mathbf{T}^*)^{\vee}$ . □

**Corollary 4.1.8.** Assume that  $\mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}) \neq 0$  and that the dual Selmer group admits a pseudo-isomorphisms

$$\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee \approx \Lambda^r \times \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}})$$

where  $r$  is a positive integer and the  $f_i$  are either distinguished irreducible polynomials or powers of  $p$ , pairwise different and  $\alpha_{i,j}$  are integers satisfying that  $\alpha_{i,1} \geq \dots \geq \alpha_{i,k_i}$ . For every  $j$ , there is an ultraprime  $\mathfrak{u}$  such that

$$\mathbf{H}_{\mathcal{F}^*(\mathfrak{u})}^1(K_{\mathfrak{u}}, \mathbf{T}^*) \approx \Lambda^{r-1} \times \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}})$$

*Proof.* The composite map

$$\Lambda \longrightarrow \Lambda^r \times \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}}) \longrightarrow \mathbf{H}_{\mathcal{F}^*(\mathfrak{u})}^1(K_{\mathfrak{u}}, \mathbf{T}^*)$$

has pseudo-null cokernel. However, the lack of finite submodules in  $\Lambda$  implies that the above map is injective. By Theorem ??, there exists an ultraprime  $\mathfrak{u}$  such that

$$\text{loc}_{\mathfrak{u}} : \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}) \rightarrow \mathbf{H}_{\mathfrak{f}}^1(K_{\mathfrak{u}}, \mathbf{T})$$

has finite cokernel and the dual localization

$$\text{loc}_{\mathfrak{u}}^* : \mathbf{H}_{\mathfrak{f}}^1(K_{\mathfrak{u}}, \mathbf{T}^*)^\vee \rightarrow \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}^*)^\vee$$

is injective. The cokernel of this map is the strict Selmer group, which is pseudo-isomorphic to

$$\mathbf{H}_{(\mathcal{F}^*)(\mathfrak{u})}^1(K, \mathbf{T}^*)^\vee \cong \Lambda^{r-1} \times \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}})$$

□

**Corollary 4.1.9.** Assume that  $\mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}) \neq 0$  and that the dual Selmer group admits a pseudo-isomorphisms

$$\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee \approx \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}})$$

where the  $f_i$  are either distinguished irreducible polynomials or powers of  $p$ , pairwise different and  $\alpha_{i,j}$  are integers satisfying that  $\alpha_{i,1} \geq \dots \geq \alpha_{i,k_i}$ . For every  $j$ , there is an ultraprime  $\mathfrak{u}$  such that

$$\mathbf{H}_{\mathcal{F}^*(\mathfrak{u})}^1(K_{\mathfrak{u}}, \mathbf{T}^*) \approx \prod_{i=1}^s \prod_{j=2}^{k_i} \Lambda / (f_i^{\alpha_{i,j}})$$

*Proof.* Let  $f$  be the product of all  $f_i^{\alpha_{i,1}}$ . The pseudo isomorphism induces a map

$$\Lambda/(f) \longrightarrow \prod_{i=1}^s \Lambda/f_i^{\alpha_{i,1}} \longrightarrow \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda/(f_i^{\alpha_{i,j}}) \longrightarrow \mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee$$

By construction, the kernel of this map is pseudo-null. However,  $\Lambda/(f)$  contains no finite submodules, so the map is injective.

By Theorem ??, there exists an ultraprime  $\mathfrak{u}$  such that

$$\text{loc}_{\mathfrak{u}} : \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}) \rightarrow \mathbf{H}_{\mathfrak{f}}^1(K_{\mathfrak{u}}, \mathbf{T})$$

has finite cokernel and the dual localiztion

$$\text{loc}_{\mathfrak{u}}^* : \mathbf{H}_{\mathfrak{f}}^1(K_{\mathfrak{u}}, \mathbf{T}^*)^\vee \rightarrow \mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}^*)^\vee$$

is contained in  $f\Lambda$ . The structure of  $\mathbf{H}_{\mathcal{F}}^1(K, \mathbf{T}^*)^\vee$  implies that  $f\Lambda/\ker \text{loc}_{\mathfrak{u}}^*$  is pseudo-null, so

$$\prod_{i=1}^s \prod_{j=2}^{k_i} \Lambda/(f_i^{\alpha_{i,j}}) \approx \mathbf{H}_{\mathcal{F}_{\mathfrak{u}}^*}^1(K_{\mathfrak{u}}, \mathbf{T}^*)^\vee \quad (4.1)$$

The finiteness of the cokernel of  $\text{loc}_{\mathfrak{u}}$  implies that  $\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)$  has finite index  $\mathbf{H}_{\mathcal{F}_{\mathfrak{u}}}^1(K, \mathbf{T}^*)$ . Since

$$\mathbf{H}_{\mathcal{F}_{\mathfrak{u}}}^1(K, \mathbf{T}^*) = \mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*) \cap \mathbf{H}_{\mathcal{F}^*(\mathfrak{u})}^1(K, \mathbf{T}^*)$$

then  $\mathbf{H}_{\mathcal{F}_{\mathfrak{u}}}^1(K, \mathbf{T}^*)$  has finite index in  $\mathbf{H}_{\mathcal{F}^*(\mathfrak{u})}^1(K, \mathbf{T}^*)$ , so their Pontryagin duals are pseudo-isomorphic.  $\square$

## 4.2 Stark Systems

Let  $m, n \in \mathcal{N}$  be square-free products of Kolyvagin ultraprimes such that  $m \mid n$ . There is an exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}^m}^1(K, T) \longrightarrow \mathbf{H}_{\mathcal{F}^n}^1(K, T) \longrightarrow \prod_{\ell \mid \frac{n}{m}} \mathbf{H}_{\mathfrak{s}}^1(K_{\ell}, T)$$

By proposition A.2.1, this exact sequence induces a map

$$\Phi_{n,m} : \bigcap^{r+\nu(n)} \mathbf{H}_{\mathcal{F}^n}^1(K, T) \rightarrow \bigcap^{r+\nu(m)} \mathbf{H}_{\mathcal{F}^m}^1(K, T)$$

**Remark 4.2.1.** Note that the map  $\Phi_{n,m}$  is dependent on a choice of an isomorphism  $\mathbf{H}_{\mathfrak{s}}^1(\mathbb{Q}, T) \cong R$ , or equivalently, an element in  $\mathbf{H}_{\mathfrak{s}}^1(K_{\ell}, T)^\times$ . From now on, we assume we have fixed such isomorphism for every  $\ell \in \mathcal{P}$ .

**Lemma 4.2.2.** Let  $\mathfrak{m}, n, r \in \mathcal{N}$  be square-free products of Kolyvagin ultraprimes such that  $m \mid n \mid r$ . Then

$$\phi_{r,m} = \phi_{r,n} \circ \phi_{n,m}$$

*Proof.* do

$\square$

Therefore, the set of maps  $\phi_{n,m}$  forms an inverse system, so it makes sense to consider the elements in the inverse limit.

**Definition 4.2.3.** The set of Stark systems of  $\mathcal{F}$  is defined as the inverse limit

$$\mathbf{SS}(\mathcal{F}) := \varprojlim_{n \in \mathcal{N}} \bigcap^{r+\nu(n)} \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, T)$$

### 4.2.1 The module of Stark systems

Definition 4.2.3 might seem abstract, but the Stark systems can be controlled by their values at some particular  $n \in \mathcal{N}$ .

**Definition 4.2.4.** A *weak core vertex* of rank  $r$  is a square-free product of ultraprimes  $n \in \mathcal{N}$  such that  $\mathbf{H}_{\mathcal{F}_n^*}^1(\mathbb{Q}, \mathbf{T}^*) = 0$  and  $\mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T})$  is a free  $\Lambda$ -module of rank  $r + \nu(n)$ .

prove existence of weak core vertices

comments on the rank

The main theorem of this section shows that the Stark systems are controlled by their values at weak core vertices.

**Theorem 4.2.5.** Let  $n \in \mathcal{N}$  be a core vertex. Then the projection map

$$\mathbf{SS}(\mathcal{F}) \rightarrow \bigcap^{r+\nu(n)} \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T})$$

is an isomorphism.

**Lemma 4.2.6.** Let  $n \in \mathcal{N}$  be a weak core vertex and let  $m \in \mathcal{N}$  be such that  $n \mid m$ . Then  $m$  is also a weak core vertex.

*Proof.* Since  $n \mid m$ , then  $\mathbf{H}_{\mathcal{F}_m}^1(\mathbb{Q}, T)$  is contained in  $\mathbf{H}_{\mathcal{F}_n}^1(\mathbb{Q}, T)$ , so it also vanishes. The exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T}) \longrightarrow \mathbf{H}_{\mathcal{F}^m}^1(\mathbb{Q}, \mathbf{T}) \longrightarrow \bigoplus_{u \mid \frac{m}{n}} \mathbf{H}_s^1(\mathbb{Q}_u, \mathbf{T}) \longrightarrow 0$$

The first and third terms of this exact sequence are free modules of ranks  $r + \nu(n)$  and  $\nu(m) - \nu(n)$ . Hence  $\mathbf{H}_{\mathcal{F}^m}^1(\mathbb{Q}, \mathbf{T})$  is free of rank  $r + \nu(n)$ .  $\square$

*Proof of Theorem 4.2.5.* We only need to prove that if  $n \in \mathcal{N}$  is a core vertex and  $\ell \in \mathcal{P}$  does not divide  $n$ , the map

$$\bigcap^{r+\nu(n\ell)} \mathbf{H}_{\mathcal{F}^{n\ell}}^1(\mathbb{Q}, \mathbf{T}) \rightarrow \bigcap^{r+\nu(n)} \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T})$$

is an isomorphism. This map is induced by the exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T}) \longrightarrow \mathbf{H}_{\mathcal{F}^{n\ell}}^1(\mathbb{Q}, \mathbf{T}) \longrightarrow \mathbf{H}_s^1(\mathbb{Q}_\ell, \mathbf{T}) \longrightarrow 0$$

Since  $\text{Ext}^1(\Lambda, \Lambda) = 0$ , the dual map  $\mathbf{H}_{\mathcal{F}^{n\ell}}^1(\mathbb{Q}, \mathbf{T})^+ \rightarrow \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T})^+$  is surjective. Hence we can construct an injective map

$$\bigwedge^{r+\nu(n)} \mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T})^+ \rightarrow \bigwedge^{r+\nu(n\ell)} \mathbf{H}_{\mathcal{F}^{n\ell}}^1(\mathbb{Q}, \mathbf{T})^+$$

which turns out to be an isomorphism since both are free  $\Lambda$ -modules of rank 1. Therefore, its dual map is also an isomorphism.  $\square$

If we assume the existence of core vertices, we know that the module of Stark systems is free of rank one.

**Assumption 4.2.7.** There exist an integer  $r$  and  $n \in \mathcal{N}$  such that  $\mathbf{H}_{\mathcal{F}^*}^1(\mathbb{Q}, \mathbf{T}^*) = 0$  and  $\mathbf{H}_{\mathcal{F}^n}^1(\mathbb{Q}, \mathbf{T})$  is a free  $\Lambda$ -module of rank  $r + \nu(n)$ .

**Corollary 4.2.8.** Under assumption 4.2.7, the module of Stark systems  $\mathbf{SS}(\mathcal{F})$  is a free  $\Lambda$ -module of rank one. The generators of  $\mathbf{SS}(\mathcal{F})$  are called *primitive* Stark systems.

**Theorem 4.2.9.** Let  $\varepsilon = (\varepsilon_n)_{n \in \mathcal{N}}$  be a generator of  $\mathbf{SS}(\mathcal{F})$ . For every  $m \in \mathcal{N}$ , the image of  $\varepsilon_m \in \text{Hom}\left(\bigwedge^{r+\nu(m)} \mathbf{H}_{\mathcal{F}^m}^1(K, \mathbf{T})^+, \Lambda\right)$  contains the 0<sup>th</sup> Fitting ideal of  $\mathbf{H}_{\mathcal{F}_m^*}^1(\mathbb{Q}, \mathbf{T}^*)$  with finite index.

*Proof.* By Assumption 4.2.7 and Lemma 4.2.6, there exists a core vertex  $n$  such that  $m \mid n$ , which leads to the following exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}^n}^1(K, \mathbf{T}) \longrightarrow \mathbf{H}_{\mathcal{F}^m}^1(K, \mathbf{T}) \longrightarrow \prod_{u|n/m} \mathbf{H}_s^1(K_u, \mathbf{T}) \longrightarrow \mathbf{H}_{\mathcal{F}_m^*}^1(K, \mathbf{T}^*) \longrightarrow 0$$

which induces a map

$$\phi_{n,m} : \bigcap^{r+\nu(n)} \mathbf{H}_{\mathcal{F}^n}^1(K, \mathbf{T}) \rightarrow \bigcap^{r+\nu(m)} \mathbf{H}_{\mathcal{F}^m}^1(K, \mathbf{T})$$

Since  $\varepsilon$  generates  $\mathbf{SS}(\mathcal{F})$ , Theorem 4.2.5 implies that  $\varepsilon_n$  generates  $\bigcap^{r+\nu(n)}$ . Since  $\varepsilon_m = \phi_{n,m}(\varepsilon_n)$ , then proposition A.2.4 implies that the image of  $\varepsilon_n$  contains  $\text{Fitt}^0(\mathbf{H}_{\mathcal{F}_m^*}^1(\mathbb{Q}, \mathbf{T}^*))$  with finite index.  $\square$

### 4.2.2 Higher Fitting ideals of the Selmer group

Stark systems also determine the higher Fitting ideals of Selmer group. For that, we need to define a sequence of theta ideals associated to a Stark system, similarly to the ones defined previously to Kolyvagin systems.

**Definition 4.2.10.** Let  $\varepsilon = (\varepsilon_n)_{n \in \mathcal{N}} \in \mathbf{SS}(\mathcal{F})$  be an Stark system. For each non-negative integer  $i$ , we define the  $i^{\text{th}}$  theta ideal by

$$\Theta_i(\varepsilon) = \sum_{n \in \mathcal{N}_i} \text{Im}(\varepsilon_n)$$

where  $\varepsilon_n$  is understood as an element of  $\text{Hom}\left(\bigwedge^{r+\nu(m)} \mathbf{H}_{\mathcal{F}^m}^1(K, \mathbf{T})^+, \Lambda\right)$ .

### 4.3 Kolyvagin systems

#### 4.3.1 Definition of Kolyvagin systems

The exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}(n)_\ell}^1(\mathbb{Q}, T) \longrightarrow \mathbf{H}_{\mathcal{F}(n)}^1(\mathbb{Q}, T) \longrightarrow \mathbf{H}_f^1(\mathbb{Q}_\ell, T) \cong \Lambda$$

induces a map, using proposition A.2.1

$$\nu_\ell : \bigcap_{r=1}^r \mathbf{H}_{\mathcal{F}(n)}^1(\mathbb{Q}, T) \rightarrow \bigcap_{r=1}^{r-1} \mathbf{H}_{\mathcal{F}(n)_\ell}^1(\mathbb{Q}, T)$$

On the other hand, the exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}(n)_\ell}^1(\mathbb{Q}, T) \longrightarrow \mathbf{H}_{\mathcal{F}(n\ell)}^1(\mathbb{Q}, T) \longrightarrow \mathbf{H}_{\text{tr}}^1(\mathbb{Q}_\ell, T) \cong \Lambda$$

induces a map

$$\varphi_\ell^{\text{fs}} : \bigcap_{r=1}^r \mathbf{H}_{\mathcal{F}(n\ell)}^1(\mathbb{Q}, T) \rightarrow \bigcap_{r=1}^{r-1} \mathbf{H}_{\mathcal{F}(n)_\ell}^1(\mathbb{Q}, T)$$

**Definition 4.3.1.** A *Kolyvagin system* of rank  $r$  is an element

$$(\kappa_n)_{n \in \mathcal{N}} \in \prod_{n \in \mathcal{N}} \bigcap_r \mathbf{H}_{\mathcal{F}(n)}^1(\mathbb{Q}, T)$$

satisfying for all  $n \in \mathcal{N}$  and  $\ell \in \mathcal{P}$  not dividing  $n$  that

$$\varphi_\ell^{\text{fs}}(\kappa_{n\ell}) = \nu_\ell(\kappa_n)$$

#### 4.3.2 Regulator map

The exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}(n)}^1(\mathbb{Q}, T) \longrightarrow \mathbf{H}_{\mathcal{F}n}^1(\mathbb{Q}, T) \longrightarrow \prod_{\ell|n} \mathbf{H}_f^1(\mathbb{Q}_\ell, T) \cong \Lambda^{\nu(n)}$$

induces, by proposition A.2.1, a map

$$\text{Reg}_n : \bigcap_{r=1}^{r+\nu(n)} \mathbf{H}_{\mathcal{F}n}^1(\mathbb{Q}, T) \rightarrow \bigcap_{r=1}^r \mathbf{H}_{\mathcal{F}(n)}^1(\mathbb{Q}, T)$$

**Theorem 4.3.2.** Combined for all  $n \in \mathcal{N}$ , the maps  $\text{Reg}_n$  induce a regulator map

$$\text{Reg} : \mathbf{SS}(\mathcal{F}) \rightarrow \mathbf{KS}(\mathcal{F})$$

*Proof.*

□

**Theorem 4.3.3.** The regulator map  $\text{Reg} : \mathbf{SS}(\mathcal{F}) \rightarrow \mathbf{KS}(\mathcal{F})$  is an isomorphism.

**Theorem 4.3.4.** Let  $\kappa$  be a primitive Kolyvagin system. Then  $\text{Im}(\kappa_n)$  contains the Fitting ideal  $\text{Fitt}_0(\mathbf{H}_{\mathcal{F}(n)^*}^1(\mathbb{Q}, T^*)^\vee)$  with finite index.

*Proof.* Since  $\kappa$  is a primitive Kolyvagin system, theorem 4.3.2 implies the existence of a primitive Stark system  $\varepsilon = (\varepsilon_n)_{n \in \mathcal{N}}$  such that  $\text{Reg}(\varepsilon) = \kappa$ .

Let  $m$  be a core vertex such that  $n \mid m$ . Consider the exact sequence

$$0 \longrightarrow \mathbf{H}_{\mathcal{F}(n)}^1(\mathbb{Q}, T) \longrightarrow \mathbf{H}_{\mathcal{F}(m)}^1(\mathbb{Q}, T) \longrightarrow \bigoplus_{\ell \mid n} \mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}_\ell, T) \oplus_{\ell \mid m/n} \mathbf{H}_{\text{tr}}^1(\mathbb{Q}_\ell, T)$$

$$\mathbf{H}_{\mathcal{F}(n)^*}^1(\mathbb{Q}, T^*)^\vee \longrightarrow 0$$

The map induced by proposition A.2.1 is  $\text{Reg}_n \circ \phi_{m,n}$  and sends  $\varepsilon_m$  to  $\kappa_n$ . Hence, by proposition A.2.4,  $\text{Im}(\kappa_n)$  contains  $\text{Fitt}_0(\mathbf{H}_{\mathcal{F}}^1(\mathbb{Q}, T^*)^\vee)$  with finite index.  $\square$

**Corollary 4.3.5.** For every  $\kappa \in \text{KS}(\mathbf{T})$  and every height 1 prime ideal of  $\Lambda$ , the localization  $\text{Im}(\kappa_n)$  is contained in  $\text{Fitt}_0(\mathbf{H}_{\mathcal{F}(n)^*}^1(\mathbb{Q}, T^*)^\vee)_\beta$ .

*Proof.* Then  $\kappa$  is primitive, the corollary follows from Theorem 4.3.4 since the localization at  $\beta$  of every finite  $\Lambda$ -module vanishes.

When  $\kappa$  is not primitive, then  $\kappa = f\tilde{\kappa}$  for some  $f \in \Lambda$  and some primitive Kolyvagin system  $\tilde{\kappa}$ . Since the result is true for  $\tilde{\kappa}$  and  $\text{Im}(\kappa_n) \subset \text{Im}(\tilde{\kappa}_n)$ , the corollary also holds for  $\kappa$ .  $\square$

## 4.4 Structure of the Selmer group

### 4.4.1 Fitting ideal and $\Lambda$ -modules up to pseudo-isomorphism

Let  $M$  be a  $\Lambda$  module which admits a pseudo-isomorphism

$$M \cong \Lambda^r \times \prod_{i=1}^s \Lambda^s$$

### 4.4.2 Fitting ideals of the Selmer groups

**Lemma 4.4.1.** Let  $n$  be a core vertex. Then

$$\text{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T})) = \sum_{u \mid n} \text{Fitt}^{i-1}(\mathbf{H}_{(\mathcal{F}^*)_u}^1(K, \mathbf{T}))$$

**Corollary 4.4.2.**

$$\text{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T})^\vee) = \sum_{u \in \mathcal{P}} \text{Fitt}^{i-1}(\mathbf{H}_{(\mathcal{F}^*)_u}^1(K, \mathbf{T})^\vee)$$

**Corollary 4.4.3.**

$$\mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee) = \sum_{n \in \mathcal{N}^i(\mathcal{P})} \mathrm{Fitt}^0(\mathbf{H}_{(\mathcal{F}^*)_n}^1(K, \mathbf{T}^*)^\vee)$$

**Corollary 4.4.4.**

$$\sum_{n \in \mathcal{N}^i(\mathcal{P})} \mathrm{Fitt}^0(\mathbf{H}_{(\mathcal{F}^*)_n}^1(K, \mathbf{T}^*)^\vee) \subset \mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee)$$

with finite index.

*Proof.* Since  $\mathrm{Fitt}^0(\mathbf{H}_{(\mathcal{F}^*)_n}^1(K, \mathbf{T}^*)^\vee)$  is contained in  $\mathbf{H}_{(\mathcal{F}^*)_n}^1(K, \mathbf{T}^*)^\vee$ , then

$$\mathrm{Fitt}^0(\mathbf{H}_{(\mathcal{F}^*)_n}^1(K, \mathbf{T}^*)^\vee) \subset \mathrm{Fitt}^0(\mathbf{H}_{(\mathcal{F}^*)_n}^1(K, \mathbf{T}^*)^\vee)$$

Hence the proposition follows from  $\square$

Let  $\kappa$  be a primitive Kolyvagin system.

**Definition 4.4.5.** Let  $\kappa \in \mathbf{KS}(\mathbf{T})$  be a Kolyvagin system. The  $i^{\mathrm{th}}$  Theta ideal of  $\kappa$  is

$$\Theta_i(\kappa) := \sum_{n \in \mathcal{N}^i(\mathcal{P})} \mathrm{Im}(\kappa_n)$$

**Proposition 4.4.6.** Let  $\kappa \in \mathbf{KS}(\mathbf{T})$ . Then

$$\Theta_i(\kappa) \subset_{\mathrm{f}} \mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*))$$

*Proof.* By Theorem 4.3.4,

$$\mathrm{Im}(\kappa_n) \subset_{\mathrm{f}} \mathrm{Fitt}^0(\mathbf{H}_{\mathcal{F}(n)^*}^1(\mathbb{Q}, \mathbf{T}^*)^\vee)$$

Equivalently, for every height 1 prime ideal,

$$\mathrm{Im}(\kappa_n)_\beta \subset \mathrm{Fitt}^0(\mathbf{H}_{\mathcal{F}(n)^*}^1(\mathbb{Q}, \mathbf{T}^*)^\vee)_\beta$$

Hence, by corollary 4.4.4,

$$\Theta_i(\kappa)_\beta = \sum_{n \in \mathcal{N}^i(\mathcal{P})} \mathrm{Im}(\kappa_n)_\beta \subset \sum_{n \in \mathcal{N}^i(\mathcal{P})} \mathrm{Fitt}^0(\mathbf{H}_{\mathcal{F}(n)^*}^1(\mathbb{Q}, \mathbf{T}^*)^\vee)_\beta \subset \mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee)_\beta$$

Since it holds for all height 1 prime ideals  $\beta$ ,

$$\Theta_i(\kappa) \subset_{\mathrm{f}} \mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee)$$

$\square$

**Theorem 4.4.7.** Let  $\kappa \in \mathbf{KS}(\mathbf{T})$  be a primitive Kolyvagin system. Then

$$\mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee) \subset_{\mathrm{f}} \Theta_i(\kappa)$$

*Proof.*  $\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee$  is a finitely generated  $\Lambda$ -module, so it admits a pseudo-isomorphism

$$\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee \approx \Lambda^r \times \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}})$$

where  $r$  is a non-negative integer and  $f_i$  are either the prime  $p$  or irreducible distinguished polynomials.

An inductive application of Corollaries 4.1.8 and 4.1.9 proves the existence of ultraprimes  $\mathbf{u}_1, \dots, \mathbf{u}_r, \mathbf{v}_1, \dots, \mathbf{v}_t$ , where  $t$  is the maximum of  $k_1, \dots, k_s$  such that

$$\begin{aligned} \mathbf{H}_{(\mathcal{F}^*)(\mathbf{u}_1 \dots \mathbf{u}_\alpha)}^1(\mathbb{Q}, \mathbf{T}) &\approx \Lambda^{r-i} \times \prod_{i=1}^s \prod_{j=1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}}) \quad \forall \alpha = 0, \dots, r \\ \mathbf{H}_{(\mathcal{F}^*)(\mathbf{u}_1 \dots \mathbf{u}_r \mathbf{v}_1 \dots \mathbf{v}_\beta)}^1(K, \mathbf{T}^*) &\approx \prod_{i=1}^s \prod_{j=\beta+1}^{k_i} \Lambda / (f_i^{\alpha_{i,j}}) \quad \forall \beta = 0, \dots, t \end{aligned}$$

If we define  $kn_i$  as the formal square-free product of the first  $i$  primes of  $(\mathbf{u}_1, \dots, \mathbf{u}_r, \mathbf{v}_1, \dots, \mathbf{v}_s)$ , we obtain that

$$\mathrm{Fitt}^i(\mathbf{H}_{\mathcal{F}^*}^1(K, \mathbf{T}^*)^\vee) \subset_{\mathrm{f}} \mathrm{Fitt}^0(\mathbf{H}_{\mathcal{F}^*(\mathbf{n}_i)}^1)$$

By Theorem 4.3.4, the latter is contained up to finite index in  $\Theta_i$ , so this proof is concluded.  $\square$

## Chapter 5

# Cartesian systems

### 5.1 The graph of cartesian Selmer structures

**Definition 5.1.1.** We consider the graph  $\text{CART}$  whose vertices are the cartesian Selmer structures on  $T$  and there is an arrow  $\mathcal{G} \rightarrow \mathcal{F}$  joining two Selmer structures  $\mathcal{F}$  and  $\mathcal{G}$  whenever  $\mathcal{F} \leq \mathcal{G}$ .

**Proposition 5.1.2.** Let  $\mathcal{F} \leq \mathcal{G}$  be cartesian Selmer structures. Then the module

$$\mathcal{L}_{\mathcal{G}/\mathcal{F}} = \bigoplus_{u \in \mathcal{U}(\mathbb{P})} \mathbf{H}_{\mathcal{G}/\mathcal{F}}^1(K_u, T) = \bigoplus_{u \in \mathcal{U}(\mathbb{P})} \frac{\mathbf{H}_{\mathcal{G}}^1(K_u, T)}{\mathbf{H}_{\mathcal{F}}^1(K_u, T)}$$

is a free, finitely generated  $R$ -module of rank  $\chi(\mathcal{G}) - \chi(\mathcal{F})$ .

*Proof.* Since  $\mathcal{G}$  is cartesian, the  $R$ -module

$$\bigoplus_{u \in \mathcal{U}(\mathbb{P})} \mathbf{H}_{/\mathcal{G}}^1(K_u, T)$$

is torsion-free. Since  $\mathcal{L}_{\mathcal{G}/\mathcal{F}}$  is a finitely-generated submodule, it is free by the structure theorem. By Proposition 3.3.10, there is an exact sequence

$$H_{\mathcal{F}}^1(K, T) \twoheadrightarrow H_{\mathcal{G}}^1(K, T) \longrightarrow \mathcal{L}_{\mathcal{G}/\mathcal{F}} \longrightarrow H_{\mathcal{G}^*}^1(K, T^*)^\vee \twoheadrightarrow H_{\mathcal{F}^*}^1(K, T^*)^\vee$$

By Proposition 3.3.19, we see that the rank of  $\mathcal{L}_{\mathcal{G}/\mathcal{F}}$  is  $\chi(\mathcal{G}) - \chi(\mathcal{F})$ . □

**Proposition 5.1.3.** Let  $\mathcal{F} \leq \mathcal{G}$  be cartesian Selmer structures. There is a canonical homomorphism

$$\bigcap^{\chi(\mathcal{G})} \mathbf{H}_{\mathcal{G}}^1(K, T) \otimes \det(\mathcal{L}_{\mathcal{G}/\mathcal{F}}) \rightarrow \bigcap^{\chi(\mathcal{F})} \mathbf{H}_{\mathcal{F}}^1(K, T)$$

*Proof.* use general properties of biduals □

## Chapter 6

# Selmer group of an elliptic curve

### 6.0.1 Main results

The aim of this section is to apply the results from the previous one to compute the Galois structure of the classical Selmer group of an elliptic curve (defined over  $\mathbb{Q}$ ) over certain abelian extensions.

Throughout this section, let  $E/\mathbb{Q}$  be an elliptic curve defined over  $\mathbb{Q}$  and let  $p \geq 5$  be a prime number. Denote by  $N$  the conductor of  $E$  and by  $T$  the Tate module of  $E$ .

Assume the following hypothesis.

- (E1) The homomorphism  $\rho : G_{\mathbb{Q}} \rightarrow \text{Aut}(T)$  induced by the Galois action is surjective.
- (E2) Either the Manin constant  $c_0$  or  $c_1$  is prime to  $p$ .

Assumption (E1) is necessary to ensure that  $T$  satisfies the assumptions ??-??. Assumption (E2) is necessary to guarantee the integrality of the modular symbols, which will be defined below.

By the modularity theorem, there exist morphisms

$$\varphi_0 : X_0(N) \rightarrow E, \quad \varphi_1 : X_1(N) \rightarrow E$$

where  $X_0(N)$  and  $X_1(N)$  are the modular curves associated to the groups  $\Gamma_0(N)$  and  $\Gamma_1(N)$ , respectively. We may choose  $\varphi_0$  and  $\varphi_1$  of minimal degree.

The modularity theorem also proves the existence of a newform  $f$  of weight 2 and level  $N$  associated to the isogeny class of  $E$ . Fixing a Néron differential  $\omega_E$ , there exist some constants  $c_0(E)$  and  $c_1(E)$  such that<sup>1</sup>

$$\varphi_0^*(\omega) = c_0(E)2\pi i f(\tau) d\tau, \quad \varphi_1^*(\omega) = c_1(E)2\pi i f(\tau) d\tau$$

The Manin constant  $c_0(E)$  is an integer (see [Edi91, proposition 2]) and is conjecturally equal to 1 if  $E$  is an  $X_0$ -optimal elliptic curve, i.e., the degree of  $\varphi_0$  is minimal among all modular parametrizations of curves in the isogeny class of  $E$  (see [Man72, §5]). The conjecture was proven in [Maz78] if  $E$  is semistable. In particular, it is proven that,

---

<sup>1</sup>We may choose  $\varphi_0$  and  $\varphi_1$  in a way that both  $c_0(E)$  and  $c_1(E)$  are positive.

for an  $X_0$ -optimal elliptic curve,  $c_0(E)$  is only divisible by 2 and primes of additive reduction. By (E1),  $E$  does not admit any  $p$ -isogeny. Hence  $c_0(E)$  is conjecturally prime to  $p$  under assumption (E1).

The constant  $c_1(E)$  was conjectured to be 1 for all elliptic curves by Stevens in [Ste89, conjecture 1].

By the modularity theorem, we can define for an elliptic curve the modular symbols of its associated modular form. In fact, if  $f$  is the modular form associated to the isogeny class of  $E$ , the modular symbol of  $E$  for some  $\frac{a}{m} \in \mathbb{Q}$  is defined as

$$\lambda\left(\frac{a}{m}\right) := \int_{i\infty}^{\frac{a}{m}} 2\pi i f(z) dz$$

where the integral follows the vertical line in the upper half plane from the cusp at infinity to  $\frac{a}{m} \in \mathbb{Q}$ .

The modular symbols satisfy the following relation (see [WW22, lemma 5]):

$$\lambda\left(\frac{-a}{m}\right) = \overline{\lambda\left(\frac{a}{m}\right)}$$

We can consider the real and imaginary parts of the modular symbols and normalise them by one of the Néron periods  $\Omega_E^\pm$  to obtain rational numbers carrying important arithmetic information.

$$\left[\frac{a}{m}\right]^\pm = \frac{\lambda\left(\frac{a}{m}\right) \pm \lambda\left(\frac{-a}{m}\right)}{2\Omega_E^\pm} \in \mathbb{Q} \quad (6.1)$$

Assumption (E2) is required to ensure that the denominator of  $\left[\frac{a}{m}\right]^\pm$  is not divisible by  $p$ . Thus

$$\left[\frac{a}{m}\right]^\pm \in \mathbb{Z}_{(p)} \subset \mathbb{Z}_p$$

Although we need the elliptic curve  $E$  to be defined over  $\mathbb{Q}$  in order to apply the modularity theorem to make use of the modular symbols, we will study the properties of the Mordell-Weil group over a finite abelian extension  $K/\mathbb{Q}$  satisfying the following hypotheses:

- (K1)  $K/\mathbb{Q}$  is unramified at  $p$  and at every prime at which  $E$  has bad reduction.
- (K2) The degree  $[K : \mathbb{Q}]$  is prime to  $p$ .
- (K3)  $E(K_{\mathfrak{p}})[p] = \{O\}$  for every prime  $\mathfrak{p}$  of  $K$  above  $p$ .
- (K4) All the Tamagawa numbers of  $E$  over  $K$  are prime to  $p$ .
- (K5) For every character  $\chi$  of  $\text{Gal}(K/\mathbb{Q})$ , the Iwasawa main conjecture localised at  $X\Lambda$  holds for the modular form  $f_\chi$ , which is defined in (6.2) below.

Throughout this section, denote by  $G$  the Galois group  $\text{Gal}(K/\mathbb{Q})$ . Also, let  $d$  and  $c$  be the degree and the conductor of  $K/\mathbb{Q}$ , respectively. We will also denote by  $\mathcal{O}_d$  the ring of integers of  $\mathbb{Q}_p(\mu_d)$  and  $\Lambda_d := \Lambda \otimes \mathcal{O}_d$ , where  $\Lambda$  is the Iwasawa algebra defined in §??.

Assumption (K5) deserves some comment. If  $f = \sum_{n=1}^{\infty} a_n q^n$  is the newform associated to  $E$ , the  $\chi$ -twist of  $f$  is defined as

$$f_\chi = \sum_{n=1}^{\infty} \chi(n) a_n q^n \in S_2(Y_1(N \operatorname{cond}(\chi)^2), \chi^2) \quad (6.2)$$

**Remark 6.0.1.** With this definition of  $f_\chi$ , we have that

$$L(f_\chi, s) = L(E, \chi, s)$$

Indeed, the  $L$ -function of the twisted modular form is defined as

$$L(f_\chi, s) = \sum_{n=1}^{\infty} \frac{\chi(n) a_n}{n^s} = \prod_{\ell} (1 - \ell^{-s} \chi(\ell) a_\ell + \mathbf{1}_N(\ell) \ell^{1-2s} \chi(\ell)^2)^{-1}$$

where  $N$  is the level of  $f$  and  $\mathbf{1}_N(\ell)$  is the trivial Dirichlet character modulo  $N$ , given by  $\mathbf{1}_N(m) = 1$  if  $\gcd(N, m) = 1$  and  $\mathbf{1}_N(m) = 0$  otherwise.

This definition coincides with the motivic  $L$ -function of  $T_p E \otimes \mathcal{O}_d(\chi)$ , where  $\chi$  is normalised such that  $\chi(\ell) = \chi(\operatorname{Frob}_\ell)$ , where  $\operatorname{Frob}_\ell$  denotes the arithmetic Frobenius. In this setting, when  $\ell \neq p$ , the Euler factor is

$$P_\ell(T)_\chi := \det_{\mathcal{O}_d \otimes \mathbb{Q}_\ell} (1 - \operatorname{Frob}_\ell^{-1} T | ((T_p \otimes \mathcal{O}_d(\chi))^*)^{I_\ell}) = 1 - \ell \chi(\ell) a_\ell T + \mathbf{1}_N(\ell) \ell \chi(\ell)^2 T^2$$

In case,  $\ell = p$ , one would obtain the same formula using Fontaine's period ring  $B_{\text{crys}}$ :

$$P_p(T)_\chi = (1 - \operatorname{Frob}_p^{-1} T | (T_p \otimes \mathcal{O}_d(\chi))^* \otimes B_{\text{crys}}) = 1 - p \chi(p) a_p T + \mathbf{1}_N(p) p \chi(p)^2 T^2$$

Then the motivic  $L$ -function is defined as

$$L(T_p E \otimes \mathcal{O}_d(\chi), s) := \prod_{\ell} P_\ell(\ell^{-s}) = \prod_{\ell} (1 - \ell^{-s} \chi(\ell) a_\ell + \mathbf{1}_N(\ell) \ell^{1-2s} \chi(\ell)^2) = L(f_\chi, s)$$

We assume the Iwasawa main conjecture in the sense of Kato.

**Conjecture 6.0.2.** (Iwasawa main conjecture for  $f_\chi$  in the sense of Kato) Define the Iwasawa algebra

$$H_{\text{IW}}^1(\mathbb{Q}_\infty, T \otimes \mathcal{O}_d(\chi)) := \varprojlim_n H^1(\mathbb{Q}_n, T \otimes \mathcal{O}_d(\chi))$$

Also denote

$$X_\infty := \operatorname{Hom}(H_{\mathcal{F}_\Lambda}^1(\mathbb{Q}, (T \otimes \Lambda_d(\chi))^*), \mathbb{Q}_p/\mathbb{Z}_p)$$

Let  $z_{\mathbb{Q}_\infty, \chi} \in H_{\text{IW}}^1(\mathbb{Q}_\infty, T \otimes \chi)$  be the  $\chi$ -twist of Kato's zeta element (see (6.8) and (6.14)). The Iwasawa main conjecture is the equality of  $\Lambda$ -ideals

$$\operatorname{char} \left( \frac{H_{\text{IW}}^1(\mathbb{Q}_\infty, T \otimes \mathcal{O}_d(\chi))}{\Lambda z_{\mathbb{Q}_\infty, \chi}} \right) = \operatorname{char}(X_\infty)$$

**Remark 6.0.3.** By theorem ??, conjecture 6.0.2 is equivalent to the primitivity of the  $\chi$ -twisted Kato's Kolyvagin system over  $\mathbb{Q}_\infty$ . An argument analogous to remark 6.0.27 shows that this is equivalent to the primality of certain Kato's Kolyvagin system for  $f_\chi$ .

**Remark 6.0.4.** Iwasawa main conjecture for  $f_\chi$  was proven in [SU14, theorem 1] when  $p$  does not divide the level of  $f_\chi$ , which, under our assumption (K1), is equivalent to  $E$  having good reduction at  $p$ , and the existence of an auxilliary prime  $\ell \nmid N$  such that  $\chi$  is unramified at  $\ell$  and the reduction modulo  $\ell$  of the Galois representation  $\bar{\rho}_{f_\chi}$  satisfies that  $\dim_{\mathbb{F}_\ell} \bar{\rho}_{f_\chi}^{\mathcal{I}_\ell} = 1$  and  $\dim_{\mathbb{F}_\ell} \bar{\rho}_{f_\chi}^{G_{\mathbb{Q}_\ell}} = 0$ .

The proof of the Iwasawa main conjecture was extended in [FW22, theorem 1.1] to some cases in which  $E$  has bad reduction at  $p$ , assuming the existence of the above auxiliary prime  $\ell$  and that the semisimplification of  $\bar{\rho}|_{G_{\mathbb{Q}_p}}$  is different to  $\psi \oplus \psi$  and  $\psi \oplus \chi_{\text{cyc}}\psi$  for any character  $\psi$  and the cyclotomic character  $\chi_{\text{cyc}}$ .

However, assumption (K5) only assumes a weaker Iwasawa main conjecture: a special case of the following conjecture when  $\beta = X\Lambda$ .

**Conjecture 6.0.5.** (Localised Iwasawa main conjecture for  $f_\chi$ ) Let  $\beta$  be a height one prime ideal of  $\Lambda$ . The Iwasawa main conjecture localised at  $\beta$  is the equality

$$\text{ord}_\beta \left( \text{char} \left( \frac{H_{\text{IW}}^1(\mathbb{Q}_\infty, T \otimes \mathcal{O}_d(\chi))}{\Lambda z_{\mathbb{Q}_\infty, \chi}^\infty} \right) \right) = \text{ord}_\beta (\text{char}(X_\infty))$$

We want to describe the Galois structure of the classical Selmer group  $\text{Sel}(K, E[p^\infty])$ . Indeed, the Selmer group  $\text{Sel}(K, E[p^\infty])$  have a natural action of the Galois group  $\text{Gal}(K/\mathbb{Q})$ , in which the Galois automorphism acts by conjugation on the cohomology group. Hence, it has a  $\mathbb{Z}_p[G]$ -module structure, which is the one we are interested in.

By Shapiro's lemma (see [NSW00, proposition 1.6.4]), there is an isomorphism

$$H^1(K, T) \cong H^1 \left( \mathbb{Q}, \text{Ind}_{G_K}^{G_\mathbb{Q}}(T) \right) \cong H^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$$

At this point, it is important to make a remark on the Galois action on  $T \otimes \mathbb{Z}_p[G]$ . In order to construct the Galois cohomology group  $H^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$ , we need  $T \otimes \mathbb{Z}_p[G]$  to be endowed with a continuous action of  $G_\mathbb{Q}$ . It is given by the following formula:

$$\sigma(t \otimes x) = \sigma t \otimes \sigma x \quad \forall \sigma \in G, \quad \forall t \in T, \quad \forall x \in \mathbb{Z}_p[G]$$

However, cohomological conjugation endowes  $H^1(K, T)$  with a natural  $G$ -action. The way to see this action in  $H^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$  is considering  $T \otimes \mathbb{Z}_p[G]$  as a  $\mathbb{Z}_p[G]$ -module with the multiplication by the elements of  $G$  given by

$$\sigma(t \otimes x) = t \otimes x\sigma^{-1} \quad \forall \sigma \in G, \quad \forall t \in T, \quad \forall x \in \mathbb{Z}_p[G]$$

When  $T \otimes \mathbb{Z}_p[G]$  is a  $\mathbb{Z}_p[G]$ -module, then  $H^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$  is also a  $\mathbb{Z}_p[G]$ -module. In this situation, Shapiro's lemma isomorphism respects the  $\mathbb{Z}_p[G]$ -structures.

We now study the local conditions used to define the Selmer group. Let  $\ell$  be a rational prime and let  $v$  be a prime of  $K$  above  $\ell$ . Denote by  $G_{v/\ell}$  to the Galois group

$\text{Gal}(K_v/\mathbb{Q}_\ell)$ , which is canonically isomorphic to a subgroup of  $G$ . Shapiro's lemma can also be applied to the local cohomology groups.

$$H^1(K_v, T) \cong H^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G_{v/\ell}])$$

The classical local condition at a prime  $v$  of  $K$  is defined as the image of the Kummer map.

$$H_{\mathcal{F}_{\text{cl}}}^1(K_v, T) = \text{Im}\left(E(K_v) \widehat{\otimes} \mathbb{Z}_p \rightarrow H^1(K_v, T)\right)$$

When  $\ell \neq p$ , this local condition coincides with the finite cohomology subgroup:

$$H_{\mathcal{F}_{\text{cl}}}^1(K_v, T) = \ker\left(H^1(K_v, T) \rightarrow H^1(\mathcal{I}_{v/\ell}, T \otimes \mathbb{Q}_p)\right)$$

where  $\mathcal{I}_{v/\ell}$  is the inertia subgroup of  $G_{v/\ell}$ . When  $\ell = p$ , the classical condition can be described purely in terms of  $T$ , by using  $p$ -adic Hodge theory. In this case, the classical local condition coincides with the Bloch-Kato local condition defined in §??:

$$H_{\mathcal{F}_{\text{BK}}}^1(K_v, T) := \ker\left(H^1(K_v, T) \rightarrow H^1(K_v, T \otimes B_{\text{crys}})\right)$$

The Bloch-Kato Selmer structure can be defined similarly for  $H^1(\mathbb{Q}_p, T \otimes \mathbb{Z}_p[G_{v/p}])$ :

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_p, T \otimes \mathbb{Z}_p[G_{v/p}]) = \ker\left(H^1(\mathbb{Q}_p, T \otimes \mathbb{Z}_p[G_{v/p}]) \rightarrow H^1(K_v, T \otimes \mathbb{Z}_p[G_{v/p}] \otimes B_{\text{crys}})\right)$$

The isomorphism given by Shapiro's lemma identifies both Bloch-Kato conditions:

$$H_{\mathcal{F}_{\text{cl}}}^1(K, T) \cong H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$$

Since  $\mathbb{Z}_p[G]$  is not a local ring, we cannot apply the general theory of Kolyvagin systems directly. Since the order of  $G$  is prime to  $p$  by (K2), we can split the Selmer group into character parts. In order to do that, we tensor it with  $\mathcal{O}_d$ .

We thus get an isomorphism

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G]) \otimes \mathcal{O}_d \cong H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d[G]) = \bigoplus_{\chi \in \widehat{G}} H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes e_\chi \mathcal{O}_d[G])$$

where  $e_\chi$  is the idempotent element associated to the character  $\chi$ , defined in (6.9) below.

Since  $T \otimes e_\chi \mathcal{O}_d[G]$  is isomorphic to  $T \otimes \mathcal{O}_d(\chi)$ , where  $\mathcal{O}_d(\chi)$  is  $\mathcal{O}_d$  endowed with an action of  $G$  given by  $\sigma x = \chi(\sigma)x$ , we have an isomorphism

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G]) \otimes \mathcal{O}_d \cong \bigoplus_{\chi \in \widehat{G}} H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi))$$

Therefore, we can study the groups  $H^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi))$  instead. The Galois structure of  $H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$  is completely determined by the  $\mathcal{O}_d$  structure of  $H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi))$  of every  $\chi$  (see §6.0.9 for examples of this process). Since  $\mathcal{O}_d$  is a principal local ring, we can apply the general theory of Kolyvagin systems to study this cohomology group.

Knowing the Fitting ideals of the twisted Selmer groups, we can determine  $H_{\mathcal{F}_{\text{BK}}}^1(K, T)$  up to isomorphism.

**Proposition 6.0.6.** The Fitting ideals of  $H_{\mathcal{F}_{\text{BK}}}^1(K, T)$  can be computed as:

$$\text{Fitt}_{\mathbb{Z}_p[G]}^i(H_{\mathcal{F}_{\text{BK}}}^1(K, T)) = \mathbb{Z}_p[G] \cap \left( \sum_{\chi \in \widehat{G}} e_{\bar{\chi}} \text{Fitt}_{\mathcal{O}_d}^i(H_{\mathcal{F}_{\text{BK}}}^1(Q, T \otimes \mathcal{O}_d(\chi))) \right) \quad (6.3)$$

Moreover, there is an isomorphism

$$H_{\mathcal{F}_{\text{BK}}}^1(K, T) \approx \bigoplus_i \mathbb{Z}_p[G]/I_i$$

where  $I_i$  are ideals of  $\mathbb{Z}_p[G]$  satisfying that  $I_{i-1} \subset I_i$  for all  $i$  and that

$$\text{Fitt}_{\mathbb{Z}_p[G]}^{i-1} H_{\mathcal{F}_{\text{BK}}}^1(K, T) = I_i \text{Fitt}_{\mathbb{Z}_p[G]}^i H_{\mathcal{F}_{\text{BK}}}^1(K, T)$$

*Proof.* By the definition of the Fitting ideals, we can compute

$$\text{Fitt}_{\mathbb{Z}_p[G]}^i(H_{\mathcal{F}_{\text{BK}}}^1(K, T)) = \text{Fitt}_{\mathcal{O}_d[G]}^i(H_{\mathcal{F}_{\text{BK}}}^1(K, T) \otimes \mathcal{O}_d)$$

Since  $\mathcal{O}_d[G] = \bigoplus_{\chi \in \widehat{G}} e_{\chi} \mathcal{O}_d[G]$ , then

$$\text{Fitt}_{\mathcal{O}_d[G]}^i(H_{\mathcal{F}_{\text{BK}}}^1(K, T) \otimes \mathcal{O}_d) = \left( \sum_{\chi \in \widehat{G}} e_{\bar{\chi}} \text{Fitt}_{\mathcal{O}_d}^i(H_{\mathcal{F}_{\text{BK}}}^1(Q, T \otimes \mathcal{O}_d(\chi))) \right)$$

Then (6.3) follows from [AM69, proposition 1.17] since every ideal of  $\mathbb{Z}_p[G]$  is a contracted ideal under the inclusion  $\mathbb{Z}_p[G] \hookrightarrow \mathcal{O}_d[G]$ . Indeed, if  $G = C_{n_1} \times \cdots \times C_{n_s}$ , where  $C_j$  represents the cyclic group of  $j$  elements and  $n_i \mid n_{i-1}$  for all  $i$ . Hence,

$$\mathbb{Z}_p[G] \cong \mathbb{Z}_p[C_{n_1}][C_{n_2}] \cdots [C_{n_s}]$$

If  $\mathcal{O}$  is an unramified discrete valuation ring with residue field  $k$  and residue characteristic  $p$  and  $j$  is prime to  $p$ , then

$$\mathcal{O}[C_j] \approx \mathcal{O}[T]/(T^j - 1) \cong \bigoplus_k \mathcal{O}[T]/(f_k(T))$$

where  $f_k(T)$  are the irreducible factors of  $T^j - 1$ , which are all distinct. By Gauss's and Hensel's lemmas, the reductions  $\bar{f}_k(T)$  are irreducible in  $k[T]$  and, therefore,  $\mathcal{O}[T]/(f_k(T))$  are unramified discrete valuation rings.

By repeating this process for every cyclic factor of  $G$ , we obtain a decomposition

$$\mathbb{Z}_p[G] \approx \bigoplus_k \mathcal{O}_k$$

where every  $\mathcal{O}_{k'}$  is an unramified discrete valuation ring, associated to a Galois orbit the characters  $G \rightarrow \overline{\mathbb{Z}_p}$ .

The above decomposition implies that every non-zero ideal in  $\mathbb{Z}_p[G]$  is the product of maximal ideals. Since the zero ideal is contracted because the map  $\mathbb{Z}_p[G] \rightarrow \mathcal{O}_d[G]$  is

injective, we just need to prove that the maximal ideals of  $\mathbb{Z}_p[G]$  are contracted. Every maximal ideal of  $\mathbb{Z}_p[G]$  is of the form

$$\mathfrak{m}_i = \bigoplus_{k \neq i} \mathcal{O}_k \oplus p\mathcal{O}_i$$

If  $e_i$  is the idempotent element associated to  $\mathcal{O}_i$ , then there are some characters  $\chi_{i_1}, \dots, \chi_{i_t} \in \widehat{G}$  such that

$$e_i = \sum_{j=1}^t e_{\chi_{i_1}}$$

Hence

$$m_i = \mathbb{Z}_p[G] \cap \left[ \left( \sum_{j=1}^t e_{\chi_{i_1}} \right) p\mathcal{O}_d[G] + \left( 1 - \sum_{j=1}^t e_{\chi_{i_1}} \right) \mathcal{O}_d[G] \right]$$

The second part of this proposition follows by applying the structure theorem of finitely generated modules over principal ideal domains to the discrete valuation rings in the decomposition of  $\mathbb{Z}_p[G]$ .  $\square$

We have already established the  $\mathbb{Z}_p$ -module and the Selmer structure we are going to study. In order to complete the Selmer triple, we need to establish which will be our set of Kolyvagin primes  $\mathcal{P}$ .

**Definition 6.0.7.** The Selmer triple we are going to study is defined as follows.

- $T = T_p E \otimes \mathcal{O}_d(\chi)$ , where  $T_p E$  is the Tate module of the elliptic curve and  $\mathcal{O}_d(\chi)$  is  $\mathbb{Z}_p[\chi]$  twisted by a character  $\chi$  of  $G$  with values in  $\overline{\mathbb{Z}_p}$ .
- The Selmer structure is the Bloch-Kato Selmer structure (see definition ??).
- The set of Kolyvagin primes  $\mathcal{P}$  is formed by the good reduction primes that are unramified and split completely at  $K/\mathbb{Q}$ .

**Remark 6.0.8.** For every  $k \in \mathbb{N}$ , the set of primes  $\mathcal{P} \cap \mathcal{P}_k$  is  $\mathcal{P}_{k,K}$ , i.e., the primes  $\ell$  satisfying the following conditions.

- (PE0)  $E$  has good reduction at  $\ell$  and  $\ell$  is unramified in  $K/\mathbb{Q}$ .
- (PE1)  $\ell \equiv 1 \pmod{p^k}$ .
- (PE2)  $\widetilde{E}_\ell(\mathbb{F}_\ell)[p^k]$  is free of rank one over  $\mathbb{Z}/p^k$ .
- (PE3)  $\ell$  splits completely in  $K/\mathbb{Q}$ .

In order to study the structure of  $H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi))$ , we define some twists of the Kurihara numbers. Kurihara numbers were defined by M. Kurihara in [Kur14a] and [Kur14b]. In those articles, they were related to the structure of the Selmer group  $\text{Sel}(\mathbb{Q}, E[p^\infty])$  and the veracity of the Iwasawa main conjecture. The definition given by M. Kurihara was the particular case of our definition 6.0.9 below when  $\chi$  is the trivial character. In this definition, we twist the Kurihara numbers by the different characters  $\chi$  of  $G$ , so we can get information about the structure of  $H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi))$ .

**Definition 6.0.9.** Let  $n \in \mathcal{N}(\mathcal{P}_{k,K})$  and let  $\chi$  be a Dirichlet character of conductor  $c$ . We define the *twisted Kurihara number* as

$$\tilde{\delta}_{n,\chi} = \sum_{a \in (\mathbb{Z}/cn\mathbb{Z})^*} \bar{\chi}(a) \left[ \frac{a}{cn} \right]^{\chi(-1)} \left( \prod_{\ell|n} \log_{\eta_\ell}^p(a) \right) \in \mathcal{O}_d/p^{k_n} \quad (6.4)$$

where  $\eta_\ell$  is a generator of  $(\mathbb{Z}/\ell)^\times$  and  $\log_{\eta_\ell}^p(a)$  is the unique  $x \in \mathbb{Z}/p^k$  such that  $\eta_\ell^{-x}a$  has order prime to  $p$  in  $(\mathbb{Z}/\ell)^\times$  (see definition 6.0.34). Here  $k_n$  is the minimal  $k \in \mathbb{N}$  such that  $n \in \mathcal{N}_k$ .

**Remark 6.0.10.** The definition of the twisted Kurihara numbers depends on the choice of the primitive roots  $\eta_\ell$  for the prime divisors  $\ell$  of  $n$ . However, the  $p$ -adic valuation of  $\delta_{n,\chi}$  is independent of this choice.

**Remark 6.0.11.** Note that for  $n = 1$ , the Birch formula in [MTT86, (I.8.6)] relates the twisted Kurihara number with the twisted special  $L$ -value:

$$\delta_{1,\chi} = \sum_{a \in (\mathbb{Z}/c\mathbb{Z})^*} \bar{\chi}(a) \left[ \frac{a}{c} \right]^{\chi(-1)} = \frac{1}{\tau(\bar{\chi})} \frac{L(E, \chi, 1)}{\Omega_E^{\chi(-1)}}$$

where  $\tau(\chi)$  is the Gauss sum of  $\chi$ .

**Definition 6.0.12.** Define the quantities

$$\begin{aligned} \text{ord}(\delta_{n,\chi}) &:= \max\{j \in \mathbb{N} \cup \{0, \infty\} : \delta_n \in p^j(\mathcal{O}_d/p^{k_n})\} \\ \partial^{(i)}(\delta_\chi) &:= \min\{\text{ord}(\delta_{n,\chi}) : n \in \mathcal{N}, \nu(n) = i\} \\ \partial^{(\infty)}(\delta_\chi) &:= \min\{\partial^{(i)}(\delta_\chi) : i \in \mathbb{N}_0\} \end{aligned}$$

In analogy with definition ??, define the ideals  $\Theta_{i,\chi}$  as

$$\Theta_{i,\chi} = p^{\partial^{(i)}(\delta_\chi)} \mathcal{O}_d \subset \mathcal{O}_d$$

The following theorem describes the group structure of the Bloch-Kato Selmer group of  $T(\chi)$  in terms of the  $\chi$ -twisted Kurihara numbers.

**Theorem 6.0.13.** Let  $E/\mathbb{Q}$  and  $p \geq 5$  be an elliptic curve and a prime number satisfying (E1)-(E2) and let  $K/\mathbb{Q}$  be an abelian extension satisfying (K1)-(K5). Then  $\partial^{(\infty)}(\tilde{\delta}_\chi)$  is finite. Call  $r$  to the minimum  $i$  such that  $\Theta_{i,\chi} \neq 0$  and  $s$  to the minimum  $j$  such that  $\partial^{(j)}(\tilde{\delta}_\chi) = \partial^{(\infty)}(\tilde{\delta}_\chi)$ . Also, denote by  $n_i$  the exponent  $\Theta_{i,\chi} = (p)^{n_i}$  and  $a_i = \frac{n_i - n_{i+2}}{2}$ .

1. If  $\chi = \bar{\chi}$ , then

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi)) \approx \mathcal{O}_d^r \oplus (\mathcal{O}_d/p^{a_r})^2 \oplus (\mathcal{O}_d/p^{a_{r+2}})^2 \oplus \dots \oplus (\mathcal{O}_d/p^{a_{s-2}})^2$$

2. If  $\chi \neq \bar{\chi}$ , then

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi)) \approx \mathcal{O}_d^r \oplus \mathcal{O}_d/p^{n_r - n_{r+1}} \oplus \mathcal{O}_d/p^{n_{r+1} - n_{r+2}} \oplus \dots \oplus \mathcal{O}_d/p^{n_{s-1} - n_s}$$

**Remark 6.0.14.** Theorem 6.0.13 when  $K = \mathbb{Q}$  is a result of C.H. Kim in [Kim25].

**Remark 6.0.15.** It is enough to prove theorem 6.0.13 for the primitive characters of  $G$ , i.e., those of conductor  $c$ . Indeed, if  $\chi$  is a character of conductor  $m$ , consider  $K_m = K \cap \mathbb{Q}(\mu_m)$ . Note that  $\chi$  is a primitive character of  $\text{Gal}(K_m/\mathbb{Q})$ . Since  $[K : K_m]$  is prime to  $p$ ,

$$H_{\mathcal{F}_{\text{BK}}}^1(K_m, T) \cong H_{\mathcal{F}_{\text{BK}}}^1(K, T)^{\text{Gal}(K/K_m)}$$

Hence the  $\chi$  parts of both Selmer group coincide. Hence if theorem 6.0.13 holds for  $K_m$  and  $\chi$ , it also holds for  $K$  and  $\chi$ .

**Remark 6.0.16.** When  $\chi$  is the trivial character, M. Kurihara conjectured in [Kur14b] the existence of some  $n \in \mathcal{N}$  such that  $\text{ord}(\delta_n)$  is equal to zero. When  $p$  is a prime of ordinary reduction, M. Kurihara proved it under the assumptions of the non-degeneracy of the  $p$ -adic height pairing and the Iwasawa main conjecture (see [Kur14a, theorem B]). An analogue statement can be conjectured for other characters.

**Conjecture 6.0.17.** There exists some  $n \in \mathcal{N}$  such that  $\text{ord}(\delta_{n,\chi}) = 0$ . In other words,  $\partial^{(\infty)}(\delta_{n,\chi}) = 0$ .

When  $\chi$  is the trivial character, R. Sakamoto proved in [Sak22, theorem 1.2] (see also [Kim25, theorem 1.11]) that M. Kurihara's conjecture is equivalent to the Iwasawa main conjecture.

**Theorem 6.0.18.** Let  $E/\mathbb{Q}$  and  $p \geq 5$  be an elliptic curve and a prime number satisfying (E1)-(E2), let  $K/\mathbb{Q}$  be an abelian extension satisfying (K1)-(K5) and let  $\chi$  be a character of  $\text{Gal}(K/\mathbb{Q})$ . Then  $\partial^{(\infty)}(\delta_\chi) = 0$  if and only if the Iwasawa main conjecture 6.0.2 holds true.

The rest of §6 is dedicated to the proofs of theorems 6.0.13 and 6.0.18. Theorem 6.0.13 is just an application of theorems ?? and 2.5.3. In order to prove it, we need to check that the Selmer triple satisfies the assumptions of these theorems.

**Proposition 6.0.19.** The Selmer triple  $(T \otimes \mathcal{O}_d(\chi), \mathcal{F}_{\text{cl}}, \mathcal{P})$  satisfies the assumptions ??-?? made in §??.

*Proof.* Assumptions ?? and ?? are obvious. ?? holds from 6.0.8

Note that  $\mathbb{Q}(T)$  is only ramified at  $p$  and at bad primes of  $E$ , so  $\mathbb{Q}(T) \cap K$  is unramified at every prime by (K1). Since  $\mathbb{Q}$  has class number 1, then  $\mathbb{Q}(T) \cap K = \mathbb{Q}$ . Therefore, every  $\sigma \in \text{Gal}(\mathbb{Q}(T)/\mathbb{Q})$  can be lifted to some  $\tilde{\sigma} \in G_{\mathbb{Q}}$  such that  $\chi(\tilde{\sigma}) = 1$ .

Every basis of  $T$  as a  $\mathbb{Z}_p$ -module is a basis of  $T \otimes \mathcal{O}_d(\chi)$  as an  $\mathcal{O}_d$ -module. After fixing such a basis, the representation induces a map  $G_{\mathbb{Q}} \rightarrow \text{GL}_2(\mathcal{O}_d)$ . By (E1), the image of this map contains  $\text{GL}_2(\mathbb{Z}_p)$ , so ?? and ?? hold true.

Let  $\Delta \subset \text{GL}_2(\mathcal{O}_d)$  be the subgroup formed by the matrices  $\zeta I$ , where  $I$  is the identity matrix and  $\zeta$  is a  $(p-1)^{\text{th}}$ -root of unity. Since the image of the map  $G_{\mathbb{Q}} \rightarrow \text{GL}_2(\mathcal{O}_d)$  considered above contains  $\text{GL}_2(\mathbb{Z}_p)$ , there is an inclusion  $\Delta \hookrightarrow \text{Gal}(\mathbb{Q}(T \otimes \mathcal{O}_d(\chi))/\mathbb{Q})$ . If we denote the latter Galois group by  $H$ , consider the inflation-restriction sequence

$$0 \longrightarrow H^1(H/\Delta, (T/p \otimes \mathcal{O}_d(\chi))^{\Delta}) \longrightarrow H^1(H, T/p \otimes \mathcal{O}_d(\chi)) \longrightarrow H^1(\Delta, T/p \otimes \mathcal{O}_d(\chi))$$

Since  $T(\chi)^\Delta = 0$  and the order of  $\Delta$  is prime to  $p$ , then  $H^1(\mathbb{Q}(T \otimes \mathcal{O}_d(\chi))/\mathbb{Q}, T/p) = 0$ . Therefore, ?? is proven since the Weil pairing implies that  $\mathbb{Q}(T, \mu_p^\infty) = \mathbb{Q}(T)$  and  $T/p \cong T^*[p]$ .

For every  $\ell \in \Sigma(\mathcal{F}_d)$  and every prime  $v$  of  $K$  above  $\ell$ , let  $G_{v/\ell} = \text{Gal}(K_v/\mathbb{Q}_\ell)$  and let  $H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_\ell, T \otimes \mathcal{O}_d(\chi))$  be the quotient  $H^1(\mathbb{Q}_\ell, T \otimes \mathcal{O}_d(\chi))/H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_\ell, T \otimes \mathcal{O}_d(\chi))$ . Since  $\#G_v$  is prime to  $p$ ,

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_\ell, T \otimes \mathcal{O}_d(\chi)) \cong H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_\ell, T^* \otimes \mathcal{O}_d(\bar{\chi}))^\vee \cong \left( H_{\mathcal{F}_{\text{BK}}}^1(K_v, E[p^\infty] \otimes \mathcal{O}_d(\bar{\chi}))^\vee \right)_{G_{v/\ell}}$$

The last cohomology group vanishes when  $\ell \neq p$ . Otherwise, we can compute

$$H_{\mathcal{F}_{\text{BK}}}^1((K_v, E[p^\infty])^\vee \otimes \mathcal{O}_d(\chi))_{G_{v/p}} \cong \left( \varprojlim_{n \in \mathbb{N}} E(K_v)/p^n \otimes \mathcal{O}_d(\chi) \right)_{G_{v/p}} = (E(K_v) \otimes \mathcal{O}_d(\chi))_{G_{v/p}} \quad (6.5)$$

Since  $E(K_v)$  contains no  $p$ -torsion when  $v \mid p$  by (K3), then  $E(K_v)$  is a free of rank one  $\mathbb{Z}_p[G_{v/p}]$ -module. Hence  $(E(K_v) \otimes \mathcal{O}_d(\chi))_{G_{v/p}}$  is torsion-free and  $\mathcal{F}_{\text{BK}}$  is cartesian by [MR04, lemma 3.7.1]. Thus ?? holds true.

Since  $H_{\mathcal{F}_{\text{cl}}}^1(K, T) = H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathbb{Z}_p[G])$  is a self dual Galois representation by [DD09, theorem 1.1], we have that

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T/p^k \otimes \mathcal{O}_d(\chi)) \cong H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T^*[p^k] \otimes \mathcal{O}_d(\bar{\chi}))$$

and hence  $\chi(T \otimes \mathcal{O}_d(\chi), \mathcal{F}_{\text{BK}}) = 0$ , so ?? holds. For ??, it holds for the prime  $p$  by (K3). Indeed, from the computation in (6.5), one can deduce that  $H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi))$  is free of rank one over  $\mathcal{O}_d$  and, from the local duality in proposition 1.1.17, we have that

$$H^2(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi)) \cong H^0(\mathbb{Q}_p, E[p^\infty] \otimes \mathcal{O}_d(\bar{\chi}))^\vee = 0 \quad \square$$

The proof of theorems 6.0.13 and 6.0.18 is structured as follows. §6.0.2-§6.0.6 are dedicated to relate Kato's Euler system to the Kurihara numbers. In §6.0.2, we introduce Kato's Euler system for  $T_p E$ , originally constructed in [Kat04], and its link to the special  $L$ -values via the dual exponential map, following [Kat21]. In §6.0.3, we apply the twisting process explained in [Rub00, §II.4] to obtain an Euler systems for  $T \otimes \mathcal{O}_d(\chi)$ . In §6.0.4, we use the interpolation property of Mazur-Tate elements to relate them to Kato's Euler system. After applying the Kolyagin derivative, we obtain a relation between Kato's Euler system and Kurihara numbers.

This relation is obtained through the dual exponential map. Therefore, it is necessary to compute the image of the integral cohomology group under the dual exponential map, as done in §6.0.5. With this computations, we can prove the equality between the orders of the twisted Kato's Kolyagin system and the twisted Kurihara numbers in §6.0.6.

The proof of theorem 6.0.18, based on the equivalence between the Iwasawa main conjecture and the primitivity of Kato's Euler system, is concluded in §6.0.7. §6.0.8 is dedicated to the proof of theorem 6.0.13 as an application of theorems ?? and 2.5.3 and the functional equation of the Kurihara numbers ([Kur14b, lemma 5.2.1]).

### 6.0.2 Dual exponential map

K. Kato constructed in [Kat04] an Euler system for the Tate module of an elliptic curve  $T$  and defined an exponential map to relate this Euler system to the special values of the twisted  $L$ -functions of the elliptic curve.

Using the Néron differential  $\omega_E$  we had already fixed, we can define the dual exponential map (see [BK90, definition 3.10])

$$\exp_{\omega_E}^* : H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, T) \otimes \mathbb{Q}_p \rightarrow F_{\mathfrak{p}}$$

where  $F_{\mathfrak{p}}$  is the completion at a prime  $\mathfrak{p}$  above  $p$  of an abelian extension  $F/\mathbb{Q}$  and  $H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, T)$  is the quotient  $H^1(F_{\mathfrak{p}}, T)/H_{\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, T)$ .

We will sketch the construction of the exponential map from [BK90]. The following is the fundamental short exact sequence from  $p$ -adic Hodge theory

$$0 \longrightarrow \mathbb{Q}_p \longrightarrow B_{\text{crys}}^{\varphi=1} \oplus B_{\text{dR}}^+ \longrightarrow B_{\text{dR}} \longrightarrow 0 \quad (6.6)$$

where  $B_{\text{crys}}$  and  $B_{\text{dR}}$  are the crystalline and de Rahm period rings. For  $V := T \otimes \mathbb{Q}_p$ , we denote

$$D_{\text{crys}}(V) = (B_{\text{crys}} \otimes V)^{G_{F_{\mathfrak{p}}}}, \quad D_{\text{dR}}(V) = (B_{\text{dR}} \otimes V)^{G_{F_{\mathfrak{p}}}}, \quad D_{\text{dR}}(V)^+ = (B_{\text{dR}}^+ \otimes V)^{G_{F_{\mathfrak{p}}}}$$

If we consider the cohomological exact sequence in (6.6) tensored with  $V$ ,

$$0 \longrightarrow \mathbb{Q}_p \longrightarrow D_{\text{crys}}(V)^{\varphi=1} \oplus D_{\text{dR}}(V)^+ \longrightarrow D_{\text{dR}}(V) \longrightarrow H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, V) \longrightarrow 0$$

Since the tangent space of  $E$  is isomorphic to  $D_{\text{dR}}(V)/D_{\text{dR}}(V)^+$ , this exact sequence induces a surjective map

$$\exp : \tan(E/F_{\mathfrak{p}}) \rightarrow H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, V)$$

The dual  $\omega_E^*$  of the Neron differential generates the tangent space of  $E/F_{\mathfrak{p}}$  as an  $F_{\mathfrak{p}}$ -vector space, so we can consider the exponential as a map from  $F_{\mathfrak{p}}$ ,

$$\exp_{\omega_E} : F_{\mathfrak{p}} \rightarrow H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, V)$$

Its dual map is the one we will be interested in.

$$\exp_{\omega_E}^* : H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, V) \rightarrow \text{Hom}(F_{\mathfrak{p}}, \mathbb{Q}_p)$$

We can identify the latter with  $F_{\mathfrak{p}}$  via the following isomorphism

$$F_{\mathfrak{p}} \rightarrow \text{Hom}(F_{\mathfrak{p}}, \mathbb{Q}_p), \quad x \mapsto (y \mapsto \text{Tr}_{F_{\mathfrak{p}}/\mathbb{Q}_p}(xy)) \quad (6.7)$$

The above map is defined for every Galois representation using  $p$ -adic Hodge theory. However, when  $T$  is the Tate module of an elliptic curve  $E$ , the exponential map has a geometrical meaning (see [BK90, example 3.10.1]). Note that in this case

$$H_{/\mathcal{F}_{\text{BK}}}^1(F_{\mathfrak{p}}, T) = \varprojlim_n E(F_{\mathfrak{p}})/p^n$$

Then the exponential map coincides with the Lie group exponential map defined on the elliptic curve. Moreover, it can be also understood as the tensor with  $\mathbb{Q}_p$  of the formal group exponential map defined on certain power of the maximal ideal of the ring of integers of  $F_{\mathfrak{p}}$ .

We will be interested in the image under this map of elements coming from the global cohomology group  $H^1(F, T)$ . In order to do that, we consider the localisation at a rational prime  $q$  as the direct sum of the localisation maps above every prime  $v$  above  $q$

$$\text{loc}_q^s : H^1(F, V) \rightarrow \bigoplus_{v|q} H_{/\mathcal{F}_{\text{BK}}}^1(F_v, V)$$

Then there is an Euler system  $(z_F)_{F \in \Omega}$  satisfying the following interpolation property (see [Kat21], theorem 6.1). Fix an inclusion  $\overline{\mathbb{Q}} \subset \mathbb{C}$ ; for every character  $\psi$  of  $\text{Gal}(F/\mathbb{Q})$ , we have that

$$\sum_{\sigma \in \text{Gal}(F/\mathbb{Q})} \psi(\sigma) \sigma(\exp_{\omega_E}^*(\text{loc}_s^p(z_F))) = \frac{L_{S_F \cup \{p\}}(E, \psi, 1)}{\Omega^{\psi(-1)}} \in F \otimes \mathbb{Q}_p \quad (6.8)$$

where  $S_F$  is the primes ramifying at  $F/\mathbb{Q}$  and  $\Omega^{\pm}$  denote the Néron periods of  $E$ . Here  $L_{S_F \cup \{p\}}(E, \psi, 1)$  is the  $S_F \cup \{p\}$ -truncated and  $\psi$ -twisted L-function, defined as

$$L_{S_F \cup \{p\}}(E, \psi, s) = \prod_{\ell \notin S_F, \ell \neq p} (1 - a_{\ell} \psi(\ell) \ell^{-s} + \mathbf{1}_N(\ell) \psi(\ell)^2 \ell^{1-2s})^{-1}$$

Call  $w_F := \exp_{\omega_E}^*(\text{loc}_p^s(z_F))$  and, for every character  $\psi$  of  $\text{Gal}(F/\mathbb{Q})$ , define the idempotent element as

$$e_{\psi} := \frac{1}{[F : \mathbb{Q}]} \sum_{\sigma \in \text{Gal}(F/\mathbb{Q})} \overline{\psi}(\sigma) \sigma \in \mathbb{Z}_p[\psi][\text{Gal}(F/\mathbb{Q})] \quad (6.9)$$

where  $\mathbb{Z}_p[\psi]$  is the ring obtained by adjoining the values of  $\psi$  to  $\mathbb{Z}_p$ . Then equation (6.8) can be written as

$$e_{\psi} w_F = \frac{1}{[F : \mathbb{Q}]} \frac{L_{S_F \cup \{p\}}(E, \overline{\psi}, 1)}{\Omega^{\psi(-1)}} \quad (6.10)$$

For every  $n, m \in \mathbb{N}$  such that  $m \mid n$ , we use the following notation. We call  $\tilde{n}$  the product of all the primes dividing  $n$  and  $r(m, n) := \text{lcm}(\tilde{n}, m)$ . Furthermore, let  $s(m, n) := \frac{r(m, n)}{m}$  be the product of primes dividing  $n$  but not  $m$ . Note that  $m$  and  $s(m, n)$  are relatively prime. When there is no risk of confusion, we will denote these quantities by  $r$  and  $s$ .

For the remaining of this section, fix  $n \in \mathbb{N}$  divisible by neither  $p$  nor any bad prime of  $E$ . For every character  $\psi$  of conductor  $m$ , the algebraic  $L$ -value is defined as

$$\mathcal{L}_n(E, \psi) := \frac{L_{S_n \cup \{p\}}(E, \psi, 1)}{\varphi(n) e_{\overline{\psi}}(\zeta_r) \Omega^{\psi(-1)}} = (-1)^{\nu(s)} \overline{\psi}(s) \frac{\varphi(r) L_{S_n \cup \{p\}}(E, \psi, 1)}{\varphi(n) \varphi(m) e_{\overline{\psi}}(\zeta_m) \Omega^{\psi(-1)}}$$

where  $S_n$  is the set of prime divisors of  $n$  and  $\varphi$  represents the Euler totient function and  $\zeta_j = e^{\frac{2\pi i}{j}} \in \mathbb{C}$ . This is a modification of the definition in [WW22] to consider the

cases when  $\psi$  is a non-primitive character. Note that, when  $\psi$  is primitive, the product  $\varphi(n)e_{\bar{\psi}}(\zeta_r)$  coincides with the Gauss sum of  $\psi$ . It is worth mentioning that the last equality comes from the fact that

$$e_{\bar{\psi}}(\zeta_r) = \frac{\varphi(m)}{\varphi(r)} e_{\bar{\psi}}\left(\text{Tr}_{\mathbb{Q}(\mu_r)/\mathbb{Q}(\mu_m)}(\zeta_r)\right) = \frac{\varphi(m)}{\varphi(r)} e_{\bar{\psi}}\left((-1)^{\nu(s)} \zeta_m^{(s^{-1})}\right) = \frac{(-1)^{\nu(s)} \varphi(m)}{\bar{\psi}(s) \varphi(r)} e_{\bar{\psi}}(\zeta_m) \quad (6.11)$$

where  $s^{-1}$  is the inverse of  $s \bmod m$ .

If we let  $\mathcal{D}_n$  be the set of Dirichlet characters modulo  $n$ , we can define the Stickelberger element as

$$\Theta_n := \sum_{\psi \in \mathcal{D}_n} \mathcal{L}_n(E, \bar{\psi}) e_{\psi} \in \mathbb{Q}_p[\zeta_{\varphi(n)}][\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})]$$

We can lower bound the  $p$ -adic valuation of the  $\psi$ -parts of  $\Theta_n$  for certain characters. In order to do that, define

$$k'_{\psi} := v_p\left(\frac{1 - a_p \psi(p) + \mathbf{1}_N(p) \psi(p)^2}{p}\right) \quad (6.12)$$

**Proposition 6.0.20.** Let  $m \in \mathbb{N}$  be an integer prime to  $Np$  and let  $\psi$  be a character of conductor  $m$ , satisfying that  $r(m, n) = n$  or, equivalently, that  $\gcd(m, n/m) = 1$ . Then  $\psi(\Theta_n) = \mathcal{L}_n(E, \bar{\psi}) \in p^{k'_{\psi}} \mathbb{Z}_p[\psi]$ .

*Proof.* By assumption (E2) and [WW22, theorem 2], the primitive algebraic  $L$ -value, defined as  $\mathcal{L}(E, \bar{\psi}) := \frac{L(E, \bar{\psi}, 1)}{\varphi(m) e_{\bar{\psi}}(\zeta_m) \Omega^{\psi(-1)}}$  belongs to  $\mathbb{Z}_p[\psi]$ . It satisfies an explicit relation with  $\mathcal{L}_n(E, \bar{\psi})$

$$\mathcal{L}_n(E, \bar{\psi}) = (-1)^{\nu(s)} \psi(s) \frac{\varphi(r)}{\varphi(n)} \prod_{\ell \in (S_n \cup \{p\}) \setminus S_m} \left( \frac{\ell - a_{\ell} \bar{\psi}(\ell) + \mathbf{1}_N(\ell) \bar{\psi}(\ell)^2}{\ell} \right) \mathcal{L}(E, \bar{\psi})$$

When  $r = n$ , all of the terms in the right hand side belong to  $\mathbb{Z}_p[\psi]$  with the possible exception of the Euler factor at  $p$ , which has  $p$ -adic valuation  $k'_{\psi}$ , which is the same as the one of  $k'_{\psi}$ . Therefore,

$$\mathcal{L}_n(E, \bar{\psi}) \in p^{k'_{\psi}} \mathbb{Z}_p[\psi] \quad \square$$

Stickelberger elements can be also defined for every abelian extension of  $\mathbb{Q}$ . If  $F/\mathbb{Q}$  is an abelian extension of conductor  $n$ , consider the projection

$$c_{\mathbb{Q}(\mu_n), F} : \mathbb{Q}_p[\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})] \rightarrow \mathbb{Q}_p[\text{Gal}(F/\mathbb{Q})], \quad \sigma \mapsto \sigma|_F$$

**Definition 6.0.21.** Let  $F/\mathbb{Q}$  be an abelian extension of conductor  $n$ . Then we define the Stickelberger element of  $F$  as

$$\Theta_F := c_{\mathbb{Q}(\mu_n), F} \Theta_n$$

The way to relate the Stickelberger elements to Kato's Euler system is by considering their action on certain elements in  $\mathbb{Q}(\mu_n)$ .

**Definition 6.0.22.** For every  $n \in \mathbb{N}$ , consider the element

$$\xi_n = \sum_{\tilde{n}|d|n} \zeta_d$$

**Lemma 6.0.23.** If  $\psi$  is a Dirichlet character modulo  $n$  of conductor  $m$ , then

$$e_\psi(\xi_n) = e_\psi(\zeta_{r(m,n)})$$

*Proof.* For every  $d$  dividing  $n$ , let  $d' = \gcd(d, m)$ . For every  $\sigma \in \text{Gal}(\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d'}))$ , we can find a lift  $\tilde{\sigma} \in \text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q}(\mu_{d'}))$  such that

$$\tilde{\sigma}|_{\mathbb{Q}(\mu_d)} = \sigma \text{ and } \tilde{\sigma}|_{\mathbb{Q}(\mu_m)} = \text{Id}|_{\mathbb{Q}(\mu_m)}$$

Since  $\psi$  has conductor  $m$ ,

$$e_\psi(\sigma(\zeta_d)) = e_\psi(\tilde{\sigma}(\zeta_d)) = e_\psi(\zeta_d) \quad \forall \sigma \in \text{Gal}(\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d'}))$$

Therefore

$$e_\psi(\zeta_d) = \frac{1}{[\mathbb{Q}(\mu_d) : \mathbb{Q}(\mu_{d'})]} e_\psi(\text{Tr}_{\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d'})} \zeta_d)$$

Assume first that there is a prime  $\ell$  such that  $v_\ell(d) > v_\ell(m) \geq 1$ . Then  $\gcd(d, m) \mid \frac{d}{\ell}$ , so

$$\text{Tr}_{\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d'})} \zeta_d = \text{Tr}_{\mathbb{Q}(\mu_{d/\ell})/\mathbb{Q}(\mu_{d'})} \left( \text{Tr}_{\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d/\ell})} \zeta_d \right)$$

However,  $\text{Tr}_{\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d/\ell})} \zeta_d = 0$  because  $\ell \mid \frac{d}{\ell}$ . Indeed,  $\zeta_d$  is a root of the polynomial  $P(T) = T^\ell - \zeta_{d/\ell}$ . Since  $[\mathbb{Q}(\mu_d) : \mathbb{Q}(\mu_{d/\ell})] = \ell$  because  $\ell^2 \mid d$ , then  $P(T)$  is irreducible. The sum of the roots of  $P$  is zero and, hence, so is the trace of  $\zeta_d$ . Therefore,  $e_\psi(\zeta_d) = 0$  in this case.

Given some  $d$  such that the above prime  $\ell$  does not exist, then  $d \mid r$ . Moreover, assume  $d < r$ . Since  $\tilde{n} \mid d$ , then  $d' < m$

$$e_\psi(\zeta_d) = \frac{1}{[\mathbb{Q}(\mu_d) : \mathbb{Q}(\mu_{d'})]} e_\psi(\text{Tr}_{\mathbb{Q}(\mu_d)/\mathbb{Q}(\mu_{d'})} \zeta_d)$$

Since  $\psi$  has conductor  $m$ , then  $e_\psi(x) = 0$  for every  $x \in \mathbb{Q}(\mu_{d'})$  and, therefore,  $e_\psi(\zeta_d) = 0$ .

The only remaining term is  $\zeta_r$ , so

$$e_\psi(\xi_n) = \sum_{\tilde{n}|d|n} e_\psi(\zeta_d) = e_\psi(\zeta_r)$$

□

The concept of  $\xi_n$  extends naturally to abelian extensions of  $\mathbb{Q}$ . Assume  $F/\mathbb{Q}$  is an abelian extension of conductor  $n$ . Define

$$\xi_F := \text{Tr}_{\mathbb{Q}(\mu_n)/F} \xi_n$$

**Corollary 6.0.24.** If  $F/\mathbb{Q}$  is an abelian extension of conductor  $n$  and  $\psi$  is a character of conductor  $m$  whose fixed field contains  $F$ , then

$$e_\psi(\xi_F) = [\mathbb{Q}(\mu_n) : F]e_\psi(\zeta_r)$$

*Proof.* Since  $F$  contains the fixed field of  $\psi$ , by lemma 6.0.23,

$$e_\psi(\xi_F) = [\mathbb{Q}(\mu_n) : F]e_\psi(\xi_n) = [\mathbb{Q}(\mu_n) : F]e_\psi(\zeta_r)$$

□

We can compute

$$e_\psi(\Theta_F(\xi_F)) = \Theta_n e_\psi(\xi_F) = [\mathbb{Q}(\mu_n) : F]\Theta_n e_\psi(\zeta_r) = [\mathbb{Q}(\mu_n) : F]\mathcal{L}_n(E, \bar{\psi})e_\psi(\zeta_r)$$

Thus,

$$e_\psi(\Theta_F(\xi_F)) = \frac{L_{S_n \cup \{p\}}(E, \bar{\psi}, 1)}{[F : \mathbb{Q}]\Omega^{\psi(-1)}} \in F \otimes \mathbb{Q}_p$$

Since that is true for all characters, we can conclude from equation (6.10) that

$$w_F = \Theta_F(\xi_F) \in F \otimes \mathbb{Q}_p \quad (6.13)$$

### 6.0.3 Twisting of Kato's Euler system

According to definition 6.0.7, we are interested in studying the representation

$$T(\chi) := T_p E \otimes \mathcal{O}_d(\chi)$$

where  $\chi$  is a primitive character of  $G$ . In order to do that, we have to apply the twisting process of Euler systems described in [Rub00, §II.4]. Define

$$z_{F,\chi} := \text{cor}_{KF/F}(z_{KF} \otimes 1_\chi) \quad (6.14)$$

where  $1_\chi$  represents the unit element in  $\mathcal{O}_d(\chi)$ .

The goal of this section is to describe the dual exponential of the twisted zeta element. In particular, with the notation of (6.13), we want to show that this value coincides with the  $\bar{\chi}$  part of  $\Theta_{KF}(\xi_{KF})$ .

**Proposition 6.0.25.** ([Rub00, proposition II.4.2]) The collection  $\{z_{F,\chi}\}_{F \in \Omega}$  is an Euler system for  $T(\chi)$ .

We will now describe the dual exponential map of  $V \otimes \mathcal{O}_d(\chi)$ . Note that  $V$  and  $V \otimes \mathcal{O}_d(\bar{\chi})$  are equal as  $G_{(KF)_w}$ -modules for every prime  $w$  of  $KF$  above  $p$ . Hence we can consider the exponential map

$$\exp : \bigoplus_{w|p} \frac{(B_{\text{dR}} \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{(KF)_w}}}{(B_{\text{dR}}^+ \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{(KF)_w}}} \rightarrow \bigoplus_{w|p} H_{\mathcal{F}_{\text{BK}}}^1((KF)_w, V \otimes \mathcal{O}_d(\bar{\chi}))$$

For every  $w$ , we have an isomorphism (depending on fixing a Weierstrass model for  $E$ )

$$\frac{(B_{\text{dR}} \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{(KF)_w}}}{(B_{\text{dR}}^+ \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{(KF)_w}}} \cong (KF)_w \otimes \mathcal{O}_d(\bar{\chi})$$

Since  $G_{w/v} := \text{Gal}((KF)_w/F_v)$  is finite, then  $H^1((KF)_w/F_v, B_{\text{dR}}^+ \otimes V \otimes \bar{\chi}) = 0$ , so

$$\left( \frac{(B_{\text{dR}} \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{(KF)_w}}}{(B_{\text{dR}}^+ \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{(KF)_w}}} \right)^{G_w} = \frac{(B_{\text{dR}} \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{F_v}}}{(B_{\text{dR}}^+ \otimes V \otimes \mathcal{O}_d(\bar{\chi}))^{G_{F_v}}}$$

By considering the direct sum over all  $w \mid p$ , the exponential map over  $F_v$  can be written as

$$\exp_{\omega_E, \bar{\chi}} : (KF \otimes \mathbb{Q}_p \otimes \mathcal{O}_d(\bar{\chi}))^{\text{Gal}(KF/F)} \rightarrow \bigoplus_{v|p} H_{\mathcal{F}_{\text{BK}}}^1(F_v, V \otimes \mathcal{O}_d(\bar{\chi}))$$

Note that the first term is the  $\chi$ -part of  $KF \otimes \mathbb{Q}_p$ . Hence the dual exponential map can be written as

$$\exp_{\omega_E, \bar{\chi}}^* : \bigoplus_{v|p} H_{\mathcal{F}_{\text{BK}}}^1(F_v, V \otimes \mathcal{O}_d(\chi)) \rightarrow \text{Hom}(e_{\chi}(KF \otimes L), \mathbb{Q}_p) \cong e_{\bar{\chi}}((KF) \otimes L)$$

where we denote  $L = \mathcal{O}_d \otimes \mathbb{Q}_p$  and the last isomorphism comes from the fact that the identification in (6.7) is Galois equivariant. Note that we are also using (6.7) to identify  $\text{Hom}(L, \mathbb{Q}_p) \cong L$ .

In an abuse of notation, we will also denote by  $\exp_{\omega_E, \bar{\chi}}^*$  to the following map

$$\exp_{\omega_E, \bar{\chi}}^* : H^1(F, V \otimes \mathcal{O}_d(\chi)) \rightarrow \bigoplus_{v|p} H_{\mathcal{F}_{\text{BK}}}^1(F_v, V \otimes \mathcal{O}_d(\chi)) \rightarrow e_{\bar{\chi}}((KF) \otimes L)$$

Now we will describe how the twisting process in (6.14) is reflected in the images of the dual exponential map.

First note that over  $KF$ , the map  $\exp_{\omega_E, \bar{\chi}}^*$  coincides with  $\exp_{\omega_E}^* \otimes \mathcal{O}_d(\chi)$ . Hence we just need to see how  $\exp_{\omega_E, \bar{\chi}}^*$  behaves under the corestriction.

**Proposition 6.0.26.** Let  $c \in H^1(F, V \otimes \mathcal{O}_d(\chi))$  and  $d = \text{cor}_{KF/F} c \in H^1(KF, V \otimes \mathcal{O}_d(\chi))$ . Then

$$\exp_{\omega_E, \bar{\chi}}^*(d) = N_{KF/F} \exp_{\omega_E, \bar{\chi}}^*(c) \in (KF \otimes \mathbb{Q}_p \otimes \mathcal{O}_d(\chi))^{G_F}$$

*Proof.* Localising at primes above  $p$ , we have that

$$\text{loc}_p^s(d) = \left( \bigoplus_{w|p} \text{cor}_{(KF)_w/F_v} \right) (\text{loc}_p^s(c))$$

By [NSW00, proposition 1.5.3 (iv)], if we understand  $\text{loc}_p^s(c)^\vee$  and  $\text{loc}_p^s(d)^\vee$  as maps into the duals of the finite cohomology groups, we have that

$$\text{loc}_p^s(c)^\vee = \text{loc}_p^s(d)^\vee \circ \left( \bigoplus_{w|p} \text{res}_{(KF)_w/F_v} \right)$$

By [NSW00, proposition 1.5.2], the following digram is commutative

$$\begin{array}{ccccc} (KF \otimes \mathbb{Q}_p \otimes \bar{\chi})^{G_F} & \xrightarrow{\exp_{\omega_E}} & \bigoplus_{v|p} H_f^1(F_v, V \otimes \bar{\chi}) & \xrightarrow{\text{loc}_p^s(d)^\vee} & \mathbb{Q}_p \\ \downarrow \subset & & \downarrow \bigoplus_{v|p} \text{res} & & \downarrow = \\ KF \otimes \mathbb{Q}_p \otimes \bar{\chi} & \xrightarrow{\exp_{\omega_E}} & \bigoplus_{w|p} H_f^1((KF)_w, V \otimes \bar{\chi}) & \xrightarrow{\text{loc}_p^s(c)^\vee} & \mathbb{Q}_p \end{array}$$

Therefore,  $\exp_{\omega_E, \chi}^*(d)$  is the restriction to  $(KF \otimes \mathbb{Q}_p \otimes \bar{\chi})^{G_F}$  of  $\exp_{\omega_E, \chi}^*(c)$ . Under the identification (6.7), that means

$$\exp_{\omega_E, \chi}^*(d) = N_{KF/F} \exp_{\omega_E, \chi}^*(c)$$

□

If  $K \cap F = \mathbb{Q}$ , the dual exponential map of the twisted Kato's Euler system is

$$w_{F, \chi} := \exp_{\omega_E, \bar{\chi}}^*(z_{F, \chi}) = N_{KF/F}(\exp_{\omega_E, \bar{\chi}}^*(z_{KF} \otimes 1_\chi)) = [K : \mathbb{Q}] e_{\bar{\chi}}(\omega_{KF})$$

By equation (6.13),

$$w_{F, \chi} = [K : \mathbb{Q}] e_{\bar{\chi}}(\Theta_{KF}(\xi_{KF})) = d e_{\bar{\chi}}(\Theta_{KF})(\xi_{KF}) \quad (6.15)$$

**Remark 6.0.27.** Kato's theory is not exclusive for elliptic curves, but can be done for modular forms. In particular, we can apply it to the modular form  $f_\chi$ , for some character  $\chi$  of  $G$ , in order to obtain an Euler system  $z_F^\chi \in H^1(F, V \otimes \mathcal{O}_d(\chi))$  satisfying the interpolation property. It is essentially the same Euler system as the one defined in (6.14).

Let  $g$  be a modular form and let  $K_g$  be its field of coefficients. Let  $\lambda$  be a prime of  $K_g$  above  $p$ . Kato defined in [Kat04, §6.3] the  $\mathbb{Q}_p$ -vector space  $V_{K_g, \lambda}(g)$  to be the maximal Hecke eigenquotient of  $H_{\text{ét}}^1(Y_1(N), K_{g, \lambda})$  associated to  $g$ . Every  $\gamma \in V_{K_g, \lambda}(g)$  can be used to construct an Euler system  $z_\gamma$  which can be characterised by an interpolation property.

If we denote  $S(g)$  to the Hecke eigenspace of  $S_2(Y_1(N))$  containing  $g$  and  $V_{\mathbb{C}}(g) = V_{K_g, \lambda}(g) \otimes_{K_g, \lambda} \mathbb{C}$ , the period map defined in [Kat04, §4.10] induces a map

$$\text{per} : S(g) \rightarrow V_{\mathbb{C}}(g)$$

Let  $F$  be a number field and let  $\psi$  be a character of  $\text{Gal}(F/\mathbb{Q})$ . Then the interpolation property for  $z_\gamma$  can be written as

$$\sum_{\sigma \in \text{Gal}(F/\mathbb{Q})} \psi(\sigma) \text{per}(\sigma(\exp^*(\text{loc}_s^p(z_{\gamma, F}))))^{\psi(-1)} = L_{S_F \cup \{p\}}(g, \chi, 1) \gamma^{\psi(-1)}$$

where, for some  $\eta \in V_{K_g, \lambda}(g)$ ,  $\eta^\pm$  denotes the projection of  $\eta$  to the eigenspace in which the complex conjugation acts by multiplication with  $\pm$ . Note that (6.8) can be obtained after choosing a suitable  $\gamma_0$  (see [Kat21, theorem 6.1]).

This interpolation property can be used to compare the  $\chi$ -twisted Euler systems constructed for  $f$  in (6.14), denoted by  $z_{F, \chi}^f$  and the Euler system for  $f_\chi$ , constructed for a suitable  $\gamma \in V_{L_\lambda}(f_\chi)$ , where  $\lambda$  is a prime of  $L$  above  $p$ . This Euler system will be denoted by  $z_{\gamma, F}^{f_\chi}$ .

We follow the argument in [Kat04, §14.6]. There is an isomorphism of Galois representations

$$\Psi : V_{\mathbb{Q}_p}(f) \otimes L_\lambda(\chi) \cong V_{L_\lambda}(f_\chi) \quad (6.16)$$

Choose  $\gamma = \Psi(\gamma_0 \otimes 1)$ . Note that  $\gamma^{\pm\chi(-1)} = \Psi(\gamma^\pm \otimes 1)$ . The isomorphism in (6.16) induces an isomorphism of cohomology groups:

$$H^1(F, V_{\mathbb{Q}_p}(f) \otimes L_\lambda(\chi)) \cong H^1(F, V_{L_\lambda}(f_\chi)) \quad (6.17)$$

Choose  $\gamma$  the image of  $\gamma_0 \otimes 1$  under the isomorphism

We claim that  $z_{\gamma, F}^{f_\chi}$  is the image of  $z_{\chi, F}^f$  under the isomorphism in (6.17). Consider the commutative diagram

$$\begin{array}{ccccc} H^1(F, V_{\mathbb{Q}_p}(f) \otimes L_\lambda(\chi)) & \xrightarrow{\exp^*} & S(f) \otimes L_\lambda(\chi) & \xrightarrow{\text{per}} & V_{\mathbb{C}}(f) \\ \downarrow \sim & & & & \downarrow \sim \\ H^1(F, V_{L_\lambda}(f_\chi)) & \xrightarrow{\exp^*} & S(f_\chi) \otimes L_\lambda & \xrightarrow{\text{per}} & V_{\mathbb{C}}(f_\chi) \end{array}$$

Following [Kat21, (6.3)], we can compute the image of the zeta elements under the composition  $\text{per} \circ \exp^*$ . If  $\psi$  is a character of  $\text{Gal}(F/\mathbb{Q})$ , we have that

$$\begin{aligned} (\text{per} \circ \exp^*)(e_\psi(z_{F, \chi}^f)) &= L_{S_F \cup \{p\}}(E, \chi\psi, 1)(\gamma_0^{\chi\psi(-1)} \otimes 1_{\mathbb{C}}) \\ (\text{per} \circ \exp^*)(e_\psi(z_{\gamma, F}^{f_\chi})) &= L_{S_F \cup \{p\}}(f_\chi, \psi, 1)(\gamma^{\psi(-1)} \otimes 1_{\mathbb{C}}) \end{aligned}$$

Since  $L_{S_F \cup \{p\}}(E, \chi\psi) = L_{S_F \cup \{p\}}(f_\chi, \psi)$  and  $\gamma_0^{\chi\psi(-1)} \otimes 1_{\mathbb{C}}$  is identified with  $\gamma^{\psi(-1)} \otimes 1_{\mathbb{C}}$  under the isomorphism on the right, the images of both zeta elements are the same under the identifications made. Since the compositions  $\text{per} \circ \exp^*$  are injective maps, we can conclude that both zeta elements are identified under the isomorphism

$$H^1(F, V_{\mathbb{Q}_p}(f) \otimes L_\lambda(\chi)) \cong H^1(F, V_{L_\lambda}(f_\chi))$$

#### 6.0.4 Mazur-Tate elements and Kolyagin derivative

Using the interpolation in (6.10), we can relate  $\omega_F$  to Mazur-Tate elements defined in [MT87]. The main advantage of this relation is that Mazur-Tate elements have an explicit formula in terms of the modular symbols defined in (6.1), which is a key fact in the relation between Kato's Euler system and the Kurihara numbers.

**Definition 6.0.28.** Let  $n \in \mathbb{Z}$ . The *Mazur-Tate modular element* for  $n$  is defined as

$$\theta_n = \sum_{a \in (\mathbb{Z}/n\mathbb{Z})^*} \left( \left[ \frac{a}{n} \right]^+ + \left[ \frac{a}{n} \right]^- \right) \sigma_a \in \mathbb{Z}_p[\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})]$$

where  $\sigma_a$  is the element of  $\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})$  that sends  $\zeta_n$  to  $\zeta_n^a$ . The integrality of the Mazur-Tate modular elements holds true under assumption (E2).

Mazur-Tate elements can be also defined for abelian extensions of  $\mathbb{Q}$ .

**Definition 6.0.29.** Let  $F/\mathbb{Q}$  be an abelian extension of conductor  $n$ . Then the Mazur-Tate element of  $F$  is defined as

$$\theta_F := c_{\mathbb{Q}(\mu_n)/F} \theta_n$$

Mazur-Tate elements can be related to special  $L$ -values by using the Birch's formula (see [MTT86, formula (8.6)])

**Proposition 6.0.30.** ([MT87, §1.4], [WW22, lemma 6, proposition 7]) If  $\psi$  is a Dirichlet character of conductor  $n$ , then

$$\psi(\theta_n) = \frac{n}{\varphi(n)e_\psi(\zeta_n)} \frac{L_{S_n}(E, \bar{\psi}, 1)}{\Omega^{\psi(-1)}} \in \mathbb{Z}_p[\psi]$$

where  $S_n$  is the set of primes dividing  $n$  and  $\varphi(n)$  is the Euler totient function. Note that the product  $\varphi(n)e_\psi(\zeta_n)$  coincides with the Gauss sum  $\tau(\bar{\psi})$ .

For primitive characters, the  $\psi$  parts of the Mazur-Tate element are easily comparable using the  $\psi$  parts of  $\Theta_n$ .

**Corollary 6.0.31.** If  $\psi$  is a Dirichlet character of conductor  $n$ , then

$$\psi(\Theta_n) = \frac{1}{n} \psi(\theta_n) (1 - p^{-1} a_p \bar{\psi}(p) - p^{-1} \mathbf{1}_N(p) \bar{\psi}(p)^2)$$

For every  $n \in \mathcal{N}_k$ , recall that  $\mathbb{Q}(n)$  is the maximal  $p$ -subextension inside  $\mathbb{Q}(\mu_n)$  and let  $K(n) := K\mathbb{Q}(n)$ . Note that there is a canonical identification

$$\text{Gal}(K(n)/\mathbb{Q}) = \text{Gal}(K/\mathbb{Q}) \times \text{Gal}(\mathbb{Q}(n)/\mathbb{Q}) = G \times \mathcal{G}_n \quad (6.18)$$

We can use corollary 6.0.31 to compare  $\Theta_{K(n)}$  and  $\theta_{K(n)}$  as elements in the group ring  $\mathbb{Z}_p[\text{Gal}(K(n)/\mathbb{Q})]$ . We follow the process in [Ota18] and [KKS20]. However, in our case, we only have the equality for the primitive character parts. That implies that both elements are not necessarily equal, but they are related enough so we can compare their Kolyvagin derivatives.

Consider the element

$$\Upsilon_{K(n)} := \Theta_{K(n)} - \frac{1}{n} (1 - p^{-1} a_p \text{Frob}_p^{-1} - p^{-1} \mathbf{1}_N(p) \text{Frob}_p^{-2}) \theta_{K(n)} \in \mathbb{Z}_p[G]$$

The following result can be deduced from corollary 6.0.31

**Corollary 6.0.32.** For every primitive character  $\psi$  of  $\text{Gal}(K(n)/\mathbb{Q})$ , we have that

$$e_\psi \Upsilon_{K(n)} = 0$$

Recall that  $\chi$  was a primitive character of  $\text{Gal}(K/\mathbb{Q})$  which was used to construct  $T(\chi)$ . Using the identification in equation (6.18), we can consider  $\chi(\Theta_n)$  and  $\chi(\theta_n)$  as elements in  $\mathbb{Z}_p[\chi][\mathcal{G}_n]$ . For every Dirichlet character  $\psi$  of conductor  $n$ , then  $\chi \times \psi$  is a primitive character of  $\text{Gal}(K(n)/\mathbb{Q})$  and we have that

$$e_{\chi \times \psi} \Upsilon_{K(n)} = 0$$

Hence

$$\chi \left( \Theta_{K(n)} - \frac{1}{n} (1 - p^{-1} a_p \text{Frob}_p^{-1} + p^{-1} \mathbf{1}_N(p) \text{Frob}_p^{-2}) \theta_{K(n)} \right) = \sum_{\ell|n} \nu_{n,n/\ell} \alpha_{n,\ell} \quad (6.19)$$

where  $\nu_{n,n\ell} : \mathbb{Q}_p[\zeta_{cn}][\mathcal{G}_{n/\ell}] \rightarrow \mathbb{Q}_p[\zeta_{cn}][\mathcal{G}_n]$  is the norm map and  $\alpha_{n,\ell}$  is certain element in  $\mathbb{Q}_p[\zeta_{cn}][\mathcal{G}_{n\ell}]$ , which we do not need to determine explicitly.

For every character  $\psi'$  of  $\text{Gal}(\mathbb{Q}(n)/\mathbb{Q})$  (not necessarily primitive),  $\chi \times \psi'$  has conductor  $m$  satisfying that  $r(m, cn) = cn$ . Therefore, proposition 6.0.20 implies that  $\chi(\Theta_{K(n)}) \in p^{k'_\chi} \mathbb{Z}_p[\mathcal{G}_n]$ . Hence  $\alpha_{n,\ell} \in p^{k'_\chi} \mathbb{Z}_p[\zeta_{cn}][\mathcal{G}_{n/\ell}]$  for every prime divisor  $\ell$  of  $n$ .

That is enough to relate the Kolyvagin derivatives of the (primitive) character parts of  $\Theta_{K(n)}$  and  $\theta_{K(n)}$ .

**Proposition 6.0.33.** Let  $\chi$  be a primitive character of  $\text{Gal}(K/\mathbb{Q})$  and let  $n \in \mathcal{N}_k$ . Then the Kolyvagin derivative, defined in definition ?? can be computed as

$$D_n \chi(\Theta_{K(n)}) \equiv \frac{1}{n} (1 - p^{-1} a_p \bar{\chi}(p) + p^{-1} \mathbf{1}_N(p) \bar{\chi}(p)^2) D_n \chi(\theta_{K(n)}) \pmod{p^{k+k'_\chi} \mathbb{Z}_p[\chi][\mathcal{G}_n]}$$

*Proof.* Note that, since  $\text{Gal}(K(n)/\mathbb{Q})$  is abelian,

$$\begin{aligned} D_n (\chi ((1 - p^{-1} a_p \text{Frob}_p^{-1} + p^{-1} \mathbf{1}_N(p) \text{Frob}_p^{-2}) \theta_{K(n)})) &= \\ \chi (1 - p^{-1} a_p \text{Frob}_p^{-1} - p^{-1} \text{Frob}_p^{-2}) D_n (\chi(\theta_{K(n)})) &= \\ (1 - p^{-1} a_p \bar{\chi}(p) + p^{-1} \mathbf{1}_N(p) \bar{\chi}(p)^2) D_n (\chi(\theta_{K(n)})) \end{aligned}$$

By equation (6.19), it is enough to prove that, for every prime divisor  $\ell$  of  $n$ ,

$$D_n \nu_{n,n/\ell} \alpha \in p^{k+k'_\chi} \mathbb{Z}_p[\psi][\mathcal{G}_n]$$

for every  $\alpha \in p^{k'_\chi} \mathbb{Z}_p[\psi][\mathcal{G}_{n/\ell}]$ . In fact, since  $\nu_{n,n/\ell} \alpha$  is  $\mathcal{G}_\ell$  invariant, then

$$D_\ell \nu_{n,n/\ell} \alpha = \frac{p^{n_\ell} (p^{n_\ell} - 1)}{2} \nu_{n,n/\ell} \alpha \in p^{k+k'_\chi} \mathbb{Z}_p[\psi][\mathcal{G}_n]$$

since  $\ell \in \mathcal{P}_k$ . Thus

$$D_n \nu_{n,n/\ell} \alpha = D_{n/\ell} D_\ell \nu_{n,n/\ell} \alpha \in p^{k+k'_\chi} \mathbb{Z}_p[\psi][\mathcal{G}_n]$$

□

By proposition ??, for every  $n \in \mathcal{N}_k$ ,  $D_n z_{K\mathbb{Q}(n)}$  is invariant under the action of  $\mathcal{G}_n$  modulo  $p^k$ . Consequently,  $D_n \Theta_{K\mathbb{Q}(n)}$  and, therefore,  $D_n \theta_{K\mathbb{Q}(n)}$  are  $\mathcal{G}_n$ -invariants modulo  $p^k$ . This is equivalent to

$$D_n \Theta_{K(n)}(\zeta_{K(n)}), D_n \theta_{K(n)}(\zeta_{K(n)}) \in K \otimes \mathbb{Q}_p$$

In order to compute this value, proposition 6.0.36 below is very useful. Before stating it, we need to define a  $p$ -primary logarithm in  $(\mathbb{Z}/\ell)^\times$ .

**Definition 6.0.34.** Assume  $H$  is a finite cyclic group whose order is exactly divisible by  $p^k$  for some  $k \in \mathbb{N}$ . If  $x$  is a generator of the  $p$ -primary part  $H$ , then for every  $a \in H$  we will define  $\log_x(a)$  to be the unique element in  $y \in \mathbb{Z}/p^k$  such that  $a^{-1}x^y$  has order prime to  $p$ .

**Remark 6.0.35.** Given two generators  $x_1$  and  $x_2$  of the  $p$ -primary part of  $H$ , the logarithms  $\log_{x_1}(a)$  and  $\log_{x_2}(a)$  have the same  $p$ -adic valuation.

**Proposition 6.0.36.** ([Sak22, lemma 3.11]) Let  $R$  be a ring, let  $n = \ell_1 \cdots \ell_s \in \mathcal{N}_k$  and let

$$\theta = \sum_{\sigma \in \mathcal{G}_n} a_\sigma \sigma \in R[\mathcal{G}_n]$$

be an element such that  $D_n \theta$  is Galois invariant modulo  $p^k$ . Then

$$D_n \theta \equiv \sum_{\sigma \in \mathcal{G}_n} a_\sigma \prod_{\ell | n} \log_{\tau_\ell}(\sigma) N_n \pmod{p^k R[\mathcal{G}_n]}$$

where  $N_n = \sum_{\sigma \in \mathcal{G}_n} \sigma$  is the norm element and  $\tau_\ell$  is the generator of  $\mathcal{G}_\ell$  used to define the Kolyvagin derivative.

*Proof.* Denoting  $T_i = \tau_{\ell_i} - 1$  for every  $i$ , we can write

$$D_n \theta = \sum_{i_1=1}^{\beta_{\ell_1}} \cdots \sum_{i_s=1}^{\beta_{\ell_s}} a_{\tau_{\ell_1}^{i_1} \cdots \tau_{\ell_s}^{i_s}} D_n (1 + T_{\ell_1})^{i_1} \cdots (1 + T_{\ell_s})^{i_s}$$

where  $\beta_{\ell_i} := \#\mathcal{G}_{\ell_i}$ . Modulo  $p^k$ , equation (??) implies that  $D_n T_{\ell_i} = -N_{\ell_i}$  and  $D_n T_{\ell_i}^2 = 0$ . Thus

$$D_n \theta \equiv a_{\tau_{\ell_1}^{i_1} \cdots \tau_{\ell_s}^{i_s}} (1 - i_1 N_{\ell_1}) \cdots (1 - i_s N_{\ell_s}) \pmod{p^k}$$

Since  $D_n \theta$  is Galois invariant, the only non-vanishing summand in the right hand side is the multiple of  $N_{\ell_1} \cdots N_{\ell_s}$ . Since  $i_i = \log_{\tau_{\ell_i}}(\sigma)$ , we have

$$D_n \theta \equiv (-1)^{\nu(n)} \sum_{\sigma \in \mathcal{G}_n} a_\sigma \prod_{\ell | n} \log_{\tau_\ell}(\sigma) \pmod{p^k}$$

□

Proposition 6.0.36 motivates definition 6.0.9 of the (twisted) Kurihara numbers.

**Remark 6.0.37.** The definition of  $\delta_{n,\chi}$  depends on the choices of the generators  $\eta_\ell \in (\mathbb{Z}/\ell)^\times$  for every  $\ell | n$ . However, by remark 6.0.35, the  $p$ -adic valuation of  $\delta_{n,\chi}$  is well defined independently of the choices made in the construction of  $\delta_{n,\chi}$ .

From propositions 6.0.33 and 6.0.36, we obtain the following.

**Corollary 6.0.38.** For every primitive character  $\chi$  of  $\text{Gal}(K/\mathbb{Q})$  and every  $n \in \mathcal{N}_k$ ,

$$D_n e_\chi(\Theta_{cn}) \equiv \frac{\varphi(n)}{n} (1 - p^{-1} a_p \bar{\chi}(p) + p^{-1} \mathbf{1}_N(p) \bar{\chi}(p)^2) \delta_{n, \bar{\chi}} e_{\chi \times \mathbf{1}_n}$$

modulo  $\frac{p^{k+k'_\chi}}{\varphi(c)} \mathbb{Z}_p[\chi][G_{\mathbb{Q}(\mu_c)/\mathbb{Q}} \times \mathcal{G}_n]$ .

*Proof.* Since  $D_n \chi(\theta_{cn}) \equiv \delta_{n, \bar{\chi}} N_n = \delta_{n, \bar{\chi}} \varphi(n) e_{\mathbf{1}_n} \pmod{p^k \mathbb{Z}_p[\mathcal{G}_n]}$  by proposition 6.0.36, the congruence holds modulo  $p^{k+k'_\chi} \varphi(c)^{-1}$  after multiplying both sides by the Euler product  $(1 - p^{-1} a_p \bar{\chi}(p) + \mathbf{1}_N(p) p^{-1} \bar{\chi}(p)^2)$  and by the idempotent element. Thus, the corollary follows from proposition 6.0.33.  $\square$

We can adapt corollary 6.0.38 to describe the  $\chi$ -part of  $\Theta_{K(n)}$  in terms of the Kurihara numbers.

**Corollary 6.0.39.** For every primitive character  $\chi$  of  $\text{Gal}(K/\mathbb{Q})$ , we have that

$$D_n e_\chi(\Theta_{K(n)}) = \frac{\varphi(n)}{n} (1 - p^{-1} a_p \bar{\chi}(p) + p^{-1} \mathbf{1}_N(p) \bar{\chi}(p)^2) \delta_{n, \bar{\chi}} e_{\chi \times \mathbf{1}_n}$$

modulo  $p^{k+k'_\chi} \mathbb{Z}_p[\chi][G \times \mathcal{G}_n]$ .

*Proof.* It follows from corollary 6.0.38, projecting the congruence to  $\mathbb{Z}_p[\chi][G \times G_n]$ .

Since both sides of that equation are invariant under the action of the Galois group  $\text{Gal}(\mathbb{Q}(\mu_c)/K)$ , whose order is  $\varphi(c)/d$ , we can remove the denominator  $\varphi(c)$  from the ideal of the congruence.  $\square$

By equation (6.15), we obtain the following corollary.

**Corollary 6.0.40.** For every primitive character  $\chi$  of  $\text{Gal}(K/\mathbb{Q})$  and every  $n \in \mathcal{N}_k$ , modulo  $p^{k+k'_\chi} \mathbb{Z}_p[G \times \mathcal{G}_n](\xi_{K(n)})$ , we have that

$$D_n(w_{\mathbb{Q}(n), \chi}) \equiv \frac{(-1)^{\nu(n)} \chi(n)}{n} (1 - p^{-1} a_p \chi(p) + p^{-1} \mathbf{1}_N(p) \chi(p)^2) \delta_{n, \chi} \varphi(c) e_{\bar{\chi}}(\zeta_c)$$

*Proof.* By the transitivity of the trace,

$$\text{Tr}_{K(n)/K}(\xi_{K(n)}) = \text{Tr}_{\mathbb{Q}(\mu_{nc})/K} \left( \sum_{n\tilde{c}|d|nc} \zeta_d \right) = (-1)^{\nu(n)} \text{Tr}_{\mathbb{Q}(\mu_c)/K} \left( \sum_{\tilde{c}|d|c} \zeta_d^{(n^{-1})} \right)$$

Denote

$$\tilde{\xi}_K = \text{Tr}_{\mathbb{Q}(\mu_c)/K} \left( \sum_{\tilde{c}|d|c} \zeta_d^{(n^{-1})} \right)$$

Since  $\chi$  has conductor  $c$ , by corollary 6.0.24

$$e_{\chi \times \mathbf{1}_n}(\xi_{K(n)}) = \frac{(-1)^{\nu(n)}}{\varphi(n)} e_\chi(\tilde{\xi}_K) = \frac{(-1)^{\nu(n)} \bar{\chi}(n)}{\varphi(n)} [\mathbb{Q}(\mu_c) : K] e_\chi(\zeta_c)$$

Since  $[\mathbb{Q}(\mu_c) : K] = \frac{\varphi(c)}{d}$ , by equation (6.15) and corollary 6.0.39, we obtain that

$$D_n(w_{\mathbb{Q}(n), \chi}) \equiv \frac{(-1)^{\nu(n)} \chi(n)}{n} (1 - p^{-1} a_p \chi(p) + p^{-1} \chi(p)^2) \delta_{n, \chi} \varphi(c) e_{\bar{\chi}}(\zeta_c) \quad \square$$

### 6.0.5 Image of Bloch-Kato dual exponential map

In §6.0.2, we have introduced the dual exponential map

$$\exp_{\omega_E}^* : H_{/\mathcal{F}_{\text{BK}}}^1(K_{\mathfrak{p}}, V) \xrightarrow{\sim} K_{\mathfrak{p}}$$

where  $K_{\mathfrak{p}}$  is the completion of  $K$  at a prime  $\mathfrak{p}$  above  $p$ . However, the group we are interested in is  $H_{/\mathcal{F}_{\text{BK}}}^1(K_{\mathfrak{p}}, T)$ . Hence we want to know the image of the composition map

$$H_{/\mathcal{F}_{\text{BK}}}^1(K_{\mathfrak{p}}, T) \rightarrow H_{/\mathcal{F}_{\text{BK}}}^1(K_{\mathfrak{p}}, V) \rightarrow K_{\mathfrak{p}}$$

By the identifications we have made so far, some  $z \in H_{/\mathcal{F}_{\text{BK}}}^1(K_{\mathfrak{p}}, T)$  is identified under local Tate duality to the map

$$E(K_{\mathfrak{p}}) \otimes \mathbb{Q}_p \rightarrow \mathbb{Q}_p, \quad x \mapsto \text{Tr}_{K_{\mathfrak{p}}/\mathbb{Q}_p}(\exp_{\omega_E}^*(z) \log_{\omega_E}(x))$$

Hence an element  $y \in K_{\mathfrak{p}}$  belongs to  $\exp_{\omega_E}^*(H_{/\mathcal{F}_{\text{BK}}}^1(K_{\mathfrak{p}}, T))$  if and only if

$$\text{Tr}_{K_{\mathfrak{p}}/\mathbb{Q}_p}(y \log_{\omega_E}(x)) \in \mathbb{Z}_p \quad \forall x \in E(K_{\mathfrak{p}}) \quad (6.20)$$

where the logarithm is the extension of the one defined in the formal group of the elliptic curve.

Denote by  $\mathcal{O}_{\mathfrak{p}}$  and  $\mathfrak{m}_{\mathfrak{p}}$  to the ring of integers of  $K_{\mathfrak{p}}$  and its maximal ideal, respectively. Denote by  $E_1(K_{\mathfrak{p}})$  the kernel of the reduction map and  $E_0(K_{\mathfrak{p}})$  the points whose reduction is a non-singular point. Since  $K_{\mathfrak{p}}/\mathbb{Q}_p$  is unramified by (K1), the logarithm induces an isomorphism

$$\log_{\omega_E} : E_1(K_{\mathfrak{p}}) \xrightarrow{\sim} \mathfrak{m}_{\mathfrak{p}}$$

To describe the image  $\log_{\omega_E}(E(K_{\mathfrak{p}}))$ , we look at the  $\chi$ -part of this map for the different characters  $\chi$  of  $\text{Gal}(K_{\mathfrak{p}}/\mathbb{Q}_p)$ . By (K3),  $E(K_{\mathfrak{p}})_{\chi}$  is free of rank one over  $\mathcal{O}[\chi]$ . Since  $p$  does not divide the Tamagawa number  $c_{\mathfrak{p}}$  by (K4), then the quotient  $E(K_{\mathfrak{p}})/E_0(K_{\mathfrak{p}})$  has order prime to  $p$ . Therefore

$$\log_{\omega_E}(E(K_{\mathfrak{p}})) = \log_{\omega_E}(E_0(K_{\mathfrak{p}}))$$

Consider the exact sequence

$$0 \longrightarrow E_1(K_{\mathfrak{p}}) \longrightarrow E_0(K_{\mathfrak{p}}) \longrightarrow \tilde{E}_0(\kappa_{\mathfrak{p}}) \longrightarrow 0$$

where  $\tilde{E}_0(\kappa_{\mathfrak{p}})$  denote the groups of non-singular points of the reduced curve modulo  $\mathfrak{p}$ . Since  $[K_{\mathfrak{p}} : \mathbb{Q}_p]$  is prime to  $p$  by (K2), the sequence remains exact after taking  $\chi$ -parts. Since  $E(K_{\mathfrak{p}})[p] = 0$  by (K3), we have that

$$\log_{\omega_E}(E_0(K_{\mathfrak{p}})_{\chi}) = \frac{1}{p^{\text{length}(\tilde{E}_0(\kappa_{\mathfrak{p}})[p^{\infty}]_{\chi})}} \log_{\omega_E}(E_1(K_{\mathfrak{p}})_{\chi})$$

Since  $K_{\mathfrak{p}}/\mathbb{Q}_p$  is unramified by (K1), then  $\log_{\omega_E}(E_1(K_{\mathfrak{p}})_{\chi}) = (\mathfrak{m}_{\mathfrak{p}})_{\chi} = p(\mathcal{O}_{\mathfrak{p}})_{\chi}$  and

$$\log_{\omega_E}(E(K_{\mathfrak{p}})_{\chi}) = \frac{p}{p^{\text{length}(\tilde{E}_0(\kappa_{\mathfrak{p}})[p^{\infty}]_{\chi})}} \mathcal{O}_{\chi} \quad (6.21)$$

The trace map satisfies, for every  $x \in K_{\mathfrak{p}}$ , the identity  $\text{Tr}(x) = \text{Tr}(e_1 x)$ , where  $e_1 \in \mathbb{Z}_p[\text{Gal}(K_{\mathfrak{p}}/\mathbb{Q}_p)]$  is the idempotent element associated to the trivial character, i.e.,  $e_1 = \frac{1}{[K_{\mathfrak{p}}:\mathbb{Q}_p]} \sum_{\sigma \in \text{Gal}(K_{\mathfrak{p}}/\mathbb{Q}_p)} \sigma$ . By (K2),  $[K_{\mathfrak{p}}:\mathbb{Q}_p]$  is prime to  $p$ . Thus  $\text{Tr}(x) \in \mathbb{Z}_p$  if and only if  $e_1 x \in \mathbb{Z}_p$ .

Moreover, note that given  $x_1, x_2 \in K_{\mathfrak{p}}$  such that  $\sigma(x_1) = \chi_1(\sigma)x_1$  and  $\sigma(x_2) = \chi_2(\sigma)x_2$  for every  $\sigma \in \text{Gal}(K_{\mathfrak{p}}/\mathbb{Q}_p)$  and some characters  $\chi_1$  and  $\chi_2$ , then  $\sigma(x_1 x_2) = (\chi_1 \chi_2)(\sigma)(x_1 x_2)$ .

Combining equations (6.20) and (6.21), we obtain

$$\exp^*(H_{/\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi))) = p^{\text{length}(\tilde{E}_0(\kappa_{\mathfrak{p}})[p^{\infty}]_{\bar{\chi}})-1} \mathcal{O}_{\bar{\chi}} \quad (6.22)$$

We will now relate the length of  $\tilde{E}_0(\kappa_{\mathfrak{p}})_{\chi}$  to the  $p$ -adic valuation of the Euler factor at  $p$  evaluated at  $s = 1$ .

**Proposition 6.0.41.** The length of  $e_{\chi}(\tilde{E}_0(\kappa_{\mathfrak{p}})[p^{\infty}])$  as an  $\mathcal{O}_d$ -module is one unit larger than the valuation of the twsited Euler factor  $1 - \frac{a_p}{p}\chi(p) + \mathbf{1}_N(p)\frac{1}{p}\chi(p)^2$  at  $p$  evaluated at  $s = 1$ .

*Proof.* Recall the definition of  $k'_{\chi} = v_p\left(1 - \frac{a_p}{p}\chi(p) + \mathbf{1}_N(\ell)\frac{1}{p}\chi(p)^2\right)$  in definition 6.0.9. We will consider different cases depending of the type of reduction of  $E$  at  $p$ .

Assume first that  $E$  has good ordinary reduction at  $p$  and let  $\alpha \in \mathbb{Z}_p^{\times}$  be the unit root of the Euler polynomial  $X^2 - a_p X + p$ . Then the arithmetic Frobenius acts on the reduced  $p$ -primary torsion  $\tilde{E}[p^{\infty}]$  by multiplication by  $\alpha$  and thus acts on  $\tilde{E}[p^{\infty}] \otimes \mathcal{O}(\bar{\chi})$  multiplying by  $\alpha \bar{\chi}(p)$ .  $\tilde{E}(\kappa_{\mathfrak{p}})_{\chi}$  is the kernel of the action of  $\text{Frob}_p - 1$  on  $\tilde{E}[p^{\infty}] \otimes \mathcal{O}(\bar{\chi})$ , so its length is the  $p$ -adic valuation of  $(\alpha \bar{\chi}(p) - 1)$ .

Thus we just need to compute the  $p$ -adic valuation of  $\alpha \bar{\chi}(p) - 1$ . The twisted Euler polynomial factors as

$$\chi(p)^2 X^2 - a_p \chi(p) X + p = \chi(p)^2 (\bar{\chi}(p)\alpha - X)(\bar{\chi}(p)\beta - X)$$

where  $\beta \in p\mathbb{Z}_p$  is the other root. Since  $\bar{\chi}(p)\beta - 1$  is a unit, evaluating at  $X = 1$  we get

$$(\chi(p)^2 - \chi(p)a_p + p) \sim (\bar{\chi}(p)\alpha - 1)$$

where  $\sim$  denotes equality up to multiplication by a  $p$ -adic unit.

If  $E$  has good supersingular reduction at  $p$ , then clearly  $\tilde{E}(\kappa_{\mathfrak{p}})[p^{\infty}] = \{0\}$ . In the supersingular case, then  $p \nmid N$  and  $p \mid a_p$ , so the  $k'_{\chi}$  has  $p$ -adic valuation  $-1$  when evaluated at  $X = 1$ . Since  $E(\kappa_{\mathfrak{p}})_{\chi} = \{0\}$ , then the proposition holds true in this case.

If  $E$  has multiplicative reduction, then  $\tilde{E}_0(\kappa_{\mathfrak{p}}) \cong \kappa_{\mathfrak{p}}^{\times}$  has order prime to  $p$ , so the  $p$ -adic valuation of the right hand side is  $-1$ . In this case,  $a_p = \pm 1$  depending on the reduction being split or not and  $\mathbf{1}_N(\ell) = 0$ , so  $k'_{\chi}$  has  $p$ -adic valuation  $-1$  as well.

If  $E$  has additive reduction, then

$$\widetilde{E}_0(\kappa_{\mathfrak{p}})_{\chi} \cong (\kappa_{\mathfrak{p}})_{\chi} = \#(\mathcal{O}_{\mathfrak{p}}/p\mathcal{O}_{\mathfrak{p}})_{\chi}$$

has length one, so the equality is also satisfied in this case.  $\square$

By (K3),  $H^2(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi)) = H^0(\mathbb{Q}_p, E[p^{\infty}] \otimes \mathcal{O}_d(\bar{\chi})) = 0$ , so there is an isomorphism

$$H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi))/p^k \cong H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T/p^k T \otimes \mathcal{O}_d(\chi))$$

The dual exponential map induces thus an isomorphism

$$H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T/p^k T \otimes \mathcal{O}_d(\chi)) \cong \frac{\exp^*_{\omega_E}(H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi)))}{p^k \exp^*_{\omega_E}(H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T \otimes \mathcal{O}_d(\chi)))} = \frac{p^{k'_{\bar{\chi}}}(\mathcal{O}_p)_{\bar{\chi}}}{p^{k+k'_{\bar{\chi}}}(\mathcal{O}_p)_{\bar{\chi}}} \quad (6.23)$$

where  $\mathcal{O}_p := \bigoplus_{\mathfrak{p}|p} \mathcal{O}_{\mathfrak{p}} \subset K \otimes \mathbb{Q}_p$ .

### 6.0.6 Kato's Kolyvagin system

In §6.0.4, we have computed the value of the dual exponential map

$$\exp^*_{\omega_E, \bar{\chi}}(D_n z_{\mathbb{Q}(n), \chi}) \equiv \frac{(-1)^{\nu(n)} \chi(n)}{n} (1 - p^{-1} a_p \chi(p) + p^{-1} \chi(p)^2) \delta_{n, \chi} \varphi(c) e_{\bar{\chi}}(\zeta_c)$$

modulo  $p^{k+k'_{\chi}} \mathbb{Z}_p[\mathcal{G}_n](\xi_{K(n)})$ . Since  $p^{k+k'_{\chi}} \mathbb{Z}_p[\mathcal{G}_n](\xi_{K(n)}) \cap K$  is contained in  $p^{k+k'_{\psi}} \mathcal{O}_p$ , the congruence also holds modulo the latter.

The goal of this section is to relate this value with Kato's Kolyvagin system. After that, we will check that the  $p$ -divisibility of Kato's Kolyvagin system and the Kurihara numbers coincide.

As defined in (??),  $\kappa_{n, \chi}$  is the preimage of  $D_n z_{\mathbb{Q}(n), \chi}$  under the restriction map

$$\text{res}_{\mathbb{Q}(n)/\mathbb{Q}} : H^1(\mathbb{Q}, T/p^k \otimes \mathcal{O}_d(\chi)) \rightarrow H^1(\mathbb{Q}(n), T/p^k \otimes \mathcal{O}_d(\chi))^{\mathcal{G}_n}$$

If we understand  $\text{loc}_p^s(\kappa_{n, \chi})$  and  $\text{loc}_v^s(D_n \omega_{\mathbb{Q}(n), \chi})$  as maps in the duals of  $H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T^* \otimes \mathcal{O}_d(\bar{\chi}))$  and  $H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}_p, T^* \otimes \mathcal{O}_d(\bar{\chi}))$ , we obtain by [NSW00, proposition 1.5.3(iv)] that

$$\text{loc}_v^s(D_n w_{n, \chi}) = \text{loc}_p^s(\kappa_{n, \chi}) \circ \text{cor}_{\mathbb{Q}(n)/\mathbb{Q}}$$

Similarly to the argument in proposition 6.0.26, we can study the behaviour of the dual exponential map under restriction maps.

**Proposition 6.0.42.** Let  $c \in H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}, V \otimes \mathcal{O}_d(\chi))$  and denote its restriction by  $d = \text{res}_{\mathbb{Q}(n)/\mathbb{Q}}(c) \in H^1_{\mathcal{F}_{\text{BK}}}(\mathbb{Q}(n), V \otimes \mathcal{O}_d(\chi))$ . Then

$$\exp^*_{\omega_E, \bar{\chi}}(c) = \exp^*_{\omega_E, \bar{\chi}}(d) \in (\mathbb{Q}(n) \otimes \mathbb{Q}_p \otimes \mathcal{O}_d(\chi))^{\mathcal{G}_n}$$

*Proof.* Localising at primes above  $p$ , we get that

$$\text{loc}_p^s(d) = \left( \bigoplus_{v|p} \text{res}_{\mathbb{Q}(n)_v/\mathbb{Q}_p} \right) (\text{loc}_p^s(c))$$

By [NSW00, proposition 1.5.3 (iv)], if  $\text{loc}_p^s(c)^\vee$  and  $\text{loc}_p^s(d)^\vee$  are considered as maps in duals of the Bloch-Kato cohomology groups, then

$$\text{loc}_p^s(d)^\vee = \text{loc}_p^s(c)^\vee \circ \left( \bigoplus_{v|p} \text{cor}_{\mathbb{Q}(n)_v/\mathbb{Q}_p} \right)$$

By [NSW00, proposition 1.5.2],  $\exp_{\omega_E, \bar{\chi}}^*(d) = \exp_{\omega_E, \bar{\chi}}^*(c) \circ N_{\mathbb{Q}(n)/\mathbb{Q}}$

By the identification in (6.7),

$$\exp_{\omega_E, \bar{\chi}}^*(c) = \exp_{\omega_E, \bar{\chi}}^*(d) \quad \square$$

Under the isomorphism in (6.23), the weak Kato's Kolyvagin system is

$$\tilde{\kappa}_{n, \chi} = \frac{(-1)^{\nu(n)} \chi(n)}{n} (1 - p^{-1} a_p \chi(p) + p^{-1} \chi(p)^2) \delta_{n, \chi} \varphi(c) e_{\bar{\chi}}(\zeta_c)$$

In order to obtain Kato's Kolyvagin system  $\kappa_\chi$  from  $\tilde{\kappa}_\chi$ , we need to apply the construction from theorem ?? . However, in this case,  $\kappa_\chi = \tilde{\kappa}_\chi$ . In fact, by the definition of Kolyvagin primes,  $a_\ell = 2 \pmod{p^k}$  for every  $\ell \mid n$ . Therefore, for every  $\ell$ , we have that

$$P_\ell = X^2 - a_\ell X + \ell \equiv (X - 1)^2 \pmod{p^k}$$

Therefore, for every  $\ell \mid n$ ,  $\rho_\ell(P_\ell(\text{Frob}_{\pi(\ell)}^{-1})) = 0$ . Hence, in the formula of theorem ?? , the only term that does not vanish is the one associated to the trivial permutation, so  $\tilde{\kappa}_{n, \chi} = \kappa_{n, \chi}$ .

Since  $p$  is unramified in  $K/\mathbb{Q}$  by (K1), then  $\varphi(c) e_{\bar{\chi}}(\zeta_c)$  generates the module  $(\mathcal{O}_p)_{\bar{\chi}}$ , and taking into account the description of the image of the dual exponential map in (6.23), we get that

$$\text{ord}(\text{loc}_s^p(\kappa_{n, \chi})) = \text{ord}(\delta_{n, \chi}) \quad (6.24)$$

### 6.0.7 Primitivity of Kato's Euler system and proof of theorem 6.0.18

In this section we will prove theorem 6.0.18. From the  $\chi$ -twisted Kato's Euler system constructed in §6.0.3, one can apply the Kolyvagin derivative process as in theorem ?? to obtain a Kolyvagin system  $\kappa_\chi^\infty \in \text{KS}(T \otimes \Lambda \otimes \mathcal{O}_d(\chi), \mathcal{F}_\Lambda, \mathcal{P})$ .

By (K3) and (K4), the assumptions in proposition ?? are satisfied, so  $\text{KS}(T \otimes \Lambda \otimes \mathcal{O}_d(\chi), \mathcal{F}_\Lambda, \mathcal{P})$  is free of rank one over  $\Lambda$  and, by theorem ?? ,  $\kappa_\chi^\infty$  is primitive if and only if the Iwasawa main conjecture 6.0.2 holds true.

Kolyvagin derivative process can be applied to obtain the Kolyvagin system  $\kappa_\chi \in \text{KS}(T \otimes \mathcal{O}_d(\chi), \mathcal{F}^{\text{can}}, \mathcal{P})$  which was studied in §6.0.6. By proposition ?? , it will be the image of  $\kappa_\chi^\infty$  under the canonical map

$$\text{KS}(T \otimes \mathcal{O}_d(\chi) \otimes \Lambda, \mathcal{F}_\Lambda, \mathcal{P}) \rightarrow \text{KS}(T \otimes \mathcal{O}_d(\chi), \mathcal{F}^{\text{can}}, \mathcal{P}) \quad (6.25)$$

By corollary ?? ,  $\kappa_\chi$  is primitive if and only if  $\kappa_\chi^\infty$  is primitive. By lemma ?? and equation (6.24), this is equivalent to  $\partial^{(\infty)}(\delta_\chi) = 0$ , which is M. Kurihara's conjecture 6.0.17.

Hence the Iwasawa main conjecture and the Kurihara conjecture are equivalent for the twist  $T \otimes \mathcal{O}_d(\chi)$ , so theorem 6.0.18 holds.

Nevertheless, a non-primitive Kolyvagin system is useful for determining the structure of the Selmer group as long as it is non-zero. If we assume hypothesis (K5), then  $\kappa_\chi^\infty \notin (X\Lambda) \text{KS}(T \otimes \Lambda \otimes \mathcal{O}_d(\chi), \mathcal{F}_\Lambda, \mathcal{P})$  by corollary ???. But this is the kernel of the map in (6.25), so this condition means that  $\kappa_\chi$  is nonzero, fact that will be necessary to apply theorems ?? and 2.5.3 in the next section.

### 6.0.8 Functional equation and proof of theorem 6.0.13

The second part of theorem 6.0.13 is a direct consequence of theorem 2.5.3. By equation (6.24), the ideals  $\Theta_i(\tilde{\delta}_\chi)$  in theorem 6.0.13 coincides with the ideals  $\Theta_i(\kappa_\chi)$  in theorem 2.5.3. By remark 6.0.15, we can assume  $\chi$  is primitive.

Theorem 2.5.3 describe the structure of the Selmer group in a different way depending on whether the character  $\chi$  is a quadratic character or not.

Assume first that  $\chi \neq \bar{\chi}$ . In this case, theorem 2.5.3 implies that the ideals  $\Theta_i(\tilde{\delta}_\chi)$

$$\Theta_i(\tilde{\delta}_\chi) = \text{Fitt}_i^{\mathcal{O}_d}(H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi)))$$

Since  $\mathcal{O}_d$  is a principal ideal domain, the structure theorem of finitely generated modules implies that

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi)) \approx \mathcal{O}_d^r \oplus \bigoplus_{i=1}^{s-r} \frac{\mathcal{O}_d}{(p)^{\partial(r+i)(\tilde{\delta}) - \partial(r+i-1)(\tilde{\delta})}}$$

where we are using the notation of theorem 6.0.13. Therefore, the proof of the second part is complete.

Now consider the case when  $\chi = \bar{\chi}$ , the module  $T \otimes \mathcal{O}_d(\chi)$  is self-dual and theorem 2.5.3 does not apply. We have to use ??? instead, which leads to a weaker control on the Fitting ideals of the Selmer group. However, Kurihara numbers satisfy a functional equation (inherited from the Mazur-Tate elements) and this fact leads to the determination of the structure of the Selmer group.

Recall that  $N$  is the conductor of the elliptic curve. The Mazur-Tate element satisfy the following functional equation

**Proposition 6.0.43.** ([MT87, §1.6]) Let  $\iota : \mathbb{Z}_p[\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})] \rightarrow \mathbb{Z}_p[\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})]$  be the map induced from the inversion in  $\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})$ . Then

$$\iota(\theta_n) = \varepsilon \sigma_{-N} \theta_n$$

where  $\varepsilon \in \{\pm 1\}$  is the root number of the elliptic curve and  $\sigma_N \in \text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})$  is the Galois automorphism that sends  $\zeta_n$  to  $\zeta_n^N$ .

**Corollary 6.0.44.** If  $\psi$  is a character of  $G$ , then

$$\iota(\bar{\psi}(\theta_{K(n)})) = \varepsilon \chi(-N) \psi(\theta_{K(n)}) \in \mathbb{Z}_p[\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})]$$

Assume  $\ell \in \mathcal{P}_k$ . Then the construction of the Kolyvagin derivative implies for every  $\theta \in \mathbb{Z}_p[\text{Gal}(\mathbb{Q}(\mu_n)/\mathbb{Q})]$  that

$$D_\ell \iota(\theta) \equiv -D_\ell(\theta) \pmod{p^k}$$

Therefore, for every  $n \in \mathcal{N}_k$ ,

$$D_n \bar{\psi}(\theta_{K(n)}) = (-1)^{\nu(n)} \varepsilon_\psi(N) D_n \psi(\theta_{K(n)})$$

Since  $\chi = \bar{\chi}$ , we have that

$$\delta_{n,\chi}(1 - (-1)^{\nu(n)} \varepsilon_\chi(-N)) = 0$$

Since  $\chi(-N) = \pm 1$ , we have two possible cases.

**Corollary 6.0.45.** Depending on the root number  $\varepsilon$  of the elliptic curve and the value  $\chi(-N)$ , we have that

- If  $\varepsilon_\chi(-N) = 1$ , then  $\delta_{n,\chi} = 0$  when  $n$  has an odd number of prime divisors.
- If  $\varepsilon_\chi(-N) = -1$ , then  $\delta_{n,\chi} = 0$  when  $n$  has an even number of prime divisors.

Call  $r = \text{rank}_{\mathcal{O}_d} H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T \otimes \mathcal{O}_d(\chi))$ . The first condition of theorem ?? is satisfied in this case, so

$$\Theta_r(\tilde{\delta}_\chi) = \text{Fitt}_r^{\mathcal{O}_d} H_{\mathcal{F}_{\text{BK}}}^1(Q, T \otimes \mathcal{O}_d(\chi))$$

For any index  $i \geq r$  having different parity than  $r$ ,  $\Theta_{i,\chi} = 0$  by corollary 6.0.45 and the corresponding Fitting ideal is non-zero. Hence the second condition of theorem ?? holds for  $i + 1$ , so

$$\Theta_{i+1}(\tilde{\delta}_\chi) = \text{Fitt}_{i+1}^{\mathcal{O}_d} H_{\mathcal{F}_{\text{BK}}}^1(Q, T \otimes \mathcal{O}_d(\chi))$$

By the structure theorem of finitely generated modules over principal ideal domains, we obtain

$$H_{\mathcal{F}_{\text{BK}}}^1(\mathbb{Q}, T(\chi)) \approx \mathcal{O}_d^r \oplus \bigoplus_{i=1}^{\frac{s-r}{2}} \frac{\mathcal{O}_d}{(p)^{\partial(r+2i)(\tilde{\delta}) - \partial(r+2i-2)(\tilde{\delta})}}$$

so theorem 6.0.13 has been proven.

### 6.0.9 Examples

We end this article by showing some examples of computations of the Selmer group of elliptic curves. All the computations are done using Sagemath [The]. For all the elliptic curves  $E$  and abelian extensions  $K/\mathbb{Q}$  appearing in these examples, we will assume that  $\text{III}(E/K)$  is finite.

**Example 6.0.46.** Consider the elliptic curve 196794cd1 in Cremona's database and the prime  $p = 5$ . Over the abelian extension  $K = \mathbb{Q}(\mu_7)$ , we can determine the full group structure of the Selmer group. We proceed by studying the twisted Kurihara number for every Dirichlet character of conductor dividing 7.

When  $\chi$  is the trivial character, we compute  $\delta_{1,\chi} = 0$ , so  $\text{rank}(E(\mathbb{Q})) \geq 1$ . To obtain further information about the structure of the Selmer group, we need to compute  $\Theta_{1,\chi}$ .

The smallest Kolyvagin prime  $\ell = 93\,251$  satisfies that  $\text{ord}_5(\delta_{\ell,\chi}) = 2$ . It guarantees that  $\text{rank}(E(\mathbb{Q})) = 1$  and  $\#\text{III}(E/\mathbb{Q})[5^\infty] \mid 25$ . If we compute  $\text{ord}_5(\delta_{\ell,\chi})$  for the smallest Kolyvagin primes, we will obtain the value 2 for approximately the 80% of the computations and a higher value in the remaining cases. That would lead us to guess that  $\Theta_2 = 25\mathbb{Z}_5$ , which is equivalent to  $\#\text{III}(E/\mathbb{Q})[5^\infty] = 25$ . However, we cannot prove it with only a finite amount of computations.

But we can use a different method to compute the order of the Tate-Shafarevich group using the Iwasawa main conjecture, which can be numerically verified it using theorem 6.0.18. The smallest Kolyvagin primes for  $k = 1$  are 11, 31 and 131. Their product  $n = 44\,671$  satisfies that  $\delta_{n,\chi} \in \mathbb{Z}_5^\times$ , so the Iwasawa main conjecture holds true in this elliptic curve.

Using Sagemath, we can check that the 5-adic  $L$ -function can be written as

$$\text{char}(X_\infty) = \mathcal{L}_5(E, T) = (5^2 + O(5^3))T + O(T^2)$$

Under our assumptions, Mazur's control theorem works perfectly, so we can conclude that  $\text{Sel}(\mathbb{Q}, T_5 E) \approx \mathbb{Z}_5 \times \mathbb{Z}_5/(5) \times \mathbb{Z}_5/(5)$ . Therefore,

$$\text{III}(E/\mathbb{Q})[5^\infty] = \text{III}(E/K)[5^\infty]^{\text{Gal}(K/\mathbb{Q})} \approx \mathbb{Z}_5/(5) \times \mathbb{Z}_5/(5)$$

If  $\chi$  is the quadratic character of conductor 7, then  $\delta_{1,\chi} = 0$ , so  $\text{rank}(E(K)_\chi) \geq 1$ . In order to determine the full structure of the twisted Selmer group, we need to compute  $\Theta_{1,\chi}$ . Since 11 is a Kolyvagin prime and  $\text{ord}_5(\delta_{11,\chi}) = 0$ , we deduce that  $\Theta_1 = \mathbb{Z}_5$ . Hence  $\text{rank}(E(K)_\chi) = 1$  and  $\text{III}(E/K)[5^\infty]_\chi = \{0\}$ .

For all other characters of conductor 7, we compute  $\text{ord}_5(\delta_{1,\chi}) = 1$ , which implies that  $\text{III}(E/K)_\chi \approx \mathcal{O}_6/(5)$ .

All the information above is enough to compute the structure of the Selmer group  $\text{Sel}(K, T_5 E) \otimes \mathcal{O}_6$  as an  $\mathcal{O}_6[\text{Gal}(K/\mathbb{Q})]$ -module. By proposition 6.0.6, the Fitting ideal are then given by the expressions

$$\begin{aligned} \text{Fitt}_{\mathbb{Z}_5}^0(\text{Sel}(K, T_5 E)) &= \frac{5}{3}(2\sigma_1 - \sigma_2 - \sigma_4) \\ \text{Fitt}_{\mathbb{Z}_5}^1(\text{Sel}(K, T_5 E)) &= 5\sigma_1 + 4(\sigma_2 + \sigma_3 + \sigma_4 + \sigma_5 + \sigma_6) \\ \text{Fitt}_{\mathbb{Z}_5}^2(\text{Sel}(K, T_5 E)) &= \frac{5}{3}\sigma_1 + \frac{2}{3}(\sigma_2 + \sigma_3 + \sigma_4 + \sigma_5 + \sigma_6) \end{aligned}$$

By proposition 6.0.6, there is an isomorphism of  $\mathbb{Z}_p[\text{Gal}(K/\mathbb{Q})]$ -modules

$$\text{Sel}(K, T_5 E) = \frac{\mathbb{Z}_p[G]}{(5(2\sigma_1 - \sigma_2 - \sigma_4))} \times \left( \frac{\mathbb{Z}_p[G]}{(5\sigma_1 + 2(\sigma_2 + \sigma_3 + \sigma_4 + \sigma_5 + \sigma_6))} \right)^2$$

**Example 6.0.47.** Let  $E$  be the elliptic curve 35a1 in Cremona's database and let  $p = 7$ . For a Dirichlet character  $\chi$  of conductor 51 and order 8 such that  $\chi(35) = -1$  and  $\chi(37)$  is a primitive 8<sup>th</sup> root of unity  $\zeta_8$  satisfying that  $\zeta_8^2 + 3\zeta_8 + 1 \in 7\mathbb{Z}_7$ .

We can compute  $\text{ord}_7(\delta_{1,\chi}) = 2$ , so we know that  $\text{rank}(E(\mathbb{Q}(\mu_{51})))_\chi = 0$  and

$$\#\text{III}(E/\mathbb{Q}(\mu_{51}))[7^\infty]_\chi = (\#(\mathcal{O}_{16}/(7)))^2$$

Note that  $\chi$  is not self-dual, so there are no non-degenerate pairings defined on the twisted Selmer group that determine its structure. In this case, the computation of  $\Theta_{1,\chi}$  is what determines whether the Tate-Shafarevich group is isomorphic to  $\mathcal{O}_{16}/(7^2)$  or  $\mathcal{O}_{16}/(7) \times \mathcal{O}_{16}/(7)$ .

The smallest Kolyvagin prime is  $\ell = 2801$  and satisfies that  $\delta_{\ell,\chi} \in \mathcal{O}_8^\times$ . Hence  $\Theta_{1,\chi} = \mathcal{O}_8$  and

$$\#\text{III}(E/\mathbb{Q}(\mu_{51}))[7^\infty]_\chi \approx \mathcal{O}_{16}/(7^2)$$

**Example 6.0.48.** Consider the elliptic curve 11a1 in Cremona's database, the abelian extension  $K = \mathbb{Q}(\mu_{61})$  and the prime  $p = 101$ .

Let  $\chi$  be the character of conductor 61 and order 20 such that  $\chi(2)$  is the unique primitive 20<sup>th</sup> root of unity in  $60 + 101\mathbb{Z}_{101}$ . Then

$$\text{ord}_{101}(\delta_{1,\chi}) = \text{ord}_{101}(\delta_{1,\bar{\chi}}) = 1$$

Theorem 6.0.13 then implies that

$$\text{Sel}(\mathbb{Q}, T_p E \otimes \mathbb{Z}_{101}(\chi)) \approx \text{Sel}(\mathbb{Q}, T_p E \otimes \mathbb{Z}_{101}(\bar{\chi})) \approx \mathbb{Z}_{101}/(101)$$

For the quadratic character  $\chi'$  of conductor 61, we obtain that  $\delta_{1,\chi'} = 0$ , so theorem 6.0.13 implies that  $\text{rank}_{\mathbb{Z}_p}(\text{Sel}(\mathbb{Q}, T_p E \otimes)) \geq 1$ . To determine the full structure of this Selmer group, we need to compute  $\Theta_{1,\chi'}$ . The smallest Kolyvagin prime is  $\ell' = 64237$  and satisfies that  $\text{ord}_{101}(\delta_{\ell',\chi'}) = 0$ . Hence,  $\Theta_{i,\chi} = \mathbb{Z}_p$ , so

$$\text{Sel}(\mathbb{Q}, T_p E \otimes \mathbb{Z}_{101}) \approx \mathbb{Z}_{101}$$

Finally, consider a character  $\chi''$  of conductor 61 and order 6. It satisfies that  $\chi(2)$  is a 6<sup>th</sup>-root of unity. Then  $\delta_{1,\chi''} = \delta_{1,\bar{\chi}''} = 0$ . The smallest Kolyvagin prime for these characters is  $\ell'' = 2528233$ , satisfying that

$$\text{ord}_{101}(\delta_{\ell'',\chi''}) = \text{ord}_{101}(\delta_{\ell'',\bar{\chi}''}) = 0$$

Hence,

$$\text{Sel}(\mathbb{Q}, T_p E \otimes \mathcal{O}_6(\chi'')) \approx \text{Sel}(\mathbb{Q}, T_p E \otimes \mathcal{O}_6(\bar{\chi}'')) \approx \mathcal{O}_6$$

Overall, assuming the finiteness of the Tate-Shafarevich group, we know that  $\text{rank}(E(K)) = 3$ . Furthermore, we know how the rank grows along the subextensions of  $K/\mathbb{Q}$ . Indeed, if  $K_2$  and  $K_3$  are the subextensions of degrees 2 and 3, respectively, we know that  $\text{rank}(E(K_2)) = 1$  and  $\text{rank}(E(K_3)) = 2$ .

Similarly, if  $L$  is a subextension of  $K/\mathbb{Q}$ , then  $\text{III}(E/L)$  would have order  $101^2$  if  $[L : \mathbb{Q}] \in 20\mathbb{Z}$  and would be trivial otherwise.

**Example 6.0.49.** We can use this method to find Tate-Shafarevich groups divisible by large primes. Consider the elliptic curve 27a1 in the Cremona tables and the prime  $p = 472558791937$ . Let  $\chi$  be the Dirichlet character of conductor 89 satisfying that  $\chi(3)$  is the unique primitive 88<sup>th</sup> root of unity in  $382613086515 + p\mathbb{Z}_p$ . Then

$$\text{ord}_p(\delta_{1,\chi}) = 1$$

Therefore, we can conclude that

$$\text{Sel}(\mathbb{Q}, T_p E \otimes \mathbb{Z}_p(\chi)) \approx \mathbb{Z}_p/(p)$$

# Appendix A

## Algebraic Preliminaries

### A.1 Fitting ideals

**Definition A.1.1.** Let  $M$  be a finitely presented  $R$ -module. Choose a resolution

$$R^n \xrightarrow{A} R^m \longrightarrow M \longrightarrow 0$$

where the map  $R^n \rightarrow R^m$  is represented by the matrix  $A$ . For every  $i \geq 0$ , we define the  $i^{\text{th}}$  Fitting ideal  $\text{Fitt}_i^R(M)$  is the ideal in  $R$  generated by the minors of size  $(m - i)$  of  $A$ .

**Remark A.1.2.** The  $i^{\text{th}}$  Fitting ideal coincides with the image of the following map, induced by the matrix  $A$ .

$$\text{Fitt}_i^R(M) = \text{Im} \left( \bigwedge^{m-i} R^n \rightarrow \bigwedge^{m-i} R^m \right)$$

It can be shown that Fitting ideals are well defined.

**Proposition A.1.3.** ([Eis95, Corollary 20.4]) The Fitting ideals  $\text{Fitt}_i^R(M)$  are independent of the chosen resolution.

When the coefficient ring  $R$  is simple enough, the sequence of Fitting ideals can recover  $M$  up to pseudo-isomorphism.

**Proposition A.1.4.** Let  $R$  be either a discrete valuation ring or a quotient of it, and let  $M$  be a finitely generated  $R$ -module. Then the Fitting ideals determine  $M$  up to isomorphism.

*Proof.* Let  $\mathfrak{m}$  be the maximal ideal of  $R$ . The structure theorem of finitely generated modules over principal ideal domains implies that there are integers  $r$ ,  $s$  and  $\alpha_1 \geq \dots \geq \alpha_s$  such that

$$M \approx R^r \times R/\mathfrak{m}^{\alpha_1} \times \dots \times R/\mathfrak{m}^{\alpha_s}$$

Then  $M$  admits a resolution

$$R^{r+s} \xrightarrow{A} R^{r+s} \longrightarrow M \longrightarrow 0$$

where the matrix  $A$  is given by

$$A = \begin{pmatrix} \mathbf{0}_{r \times r} & \mathbf{0}_{s \times r} \\ \mathbf{0}_{r \times s} & \begin{matrix} \pi^{\alpha_1} & & \\ & \ddots & \\ & & \pi^{\alpha_s} \end{matrix} \end{pmatrix}$$

where  $\pi$  is a generator of  $\mathfrak{m}$ . We can then compute,

- $i \in \{0, \dots, r-1\} \Rightarrow \text{Fitt}_i(M) = (0)$
- $j \in \{0, \dots, s-1\} \Rightarrow \text{Fitt}_{r+j} = \prod_{k=j+1}^s \mathfrak{m}^{i_k} = \mathfrak{m}^{\sum_{k=j+1}^s i_k}$
- $i \geq r+s \Rightarrow \text{Fitt}_i(M) = (1)$ .

The Fitting ideals determine  $M$  up to isomorphism, since

- $r$  is the minimum  $i$  such that  $\text{Fitt}_i(M) \neq 0$ .
- For  $i \geq 0$ ,  $\alpha_i = \text{Fitt}_{r+i+1}(M) \text{Fitt}_{r+i}(M)^{-1}$ .

□

## A.2 Preliminaries on exterior powers

The goal of this section is to introduce the necessary background to construct systems in the exterior biduals of the Selmer groups. They all have in common that they are constructed from different versions of maps of the following kind.

**Proposition A.2.1.** Consider the exact sequence of  $\Lambda$ -modules

$$0 \longrightarrow N \longrightarrow M \longrightarrow \Lambda^s$$

Then there is a canonical map

$$\Phi : \bigcap_{i=1}^{r+s} M \rightarrow \bigcap_{i=1}^r N$$

Since  $\Lambda$  is not a self-injective ring, we need to prove some basic facts about the extension groups of  $\Lambda$ -modules before addressing the proof of Proposition A.2.1.

**Lemma A.2.2.** Let  $M$  be a submodule of  $\Lambda^s$ . Then  $\text{Ext}^1(M, \Lambda)$  is finite.

*Proof.* For every  $\Lambda$ -module  $M$ , recall that  $M^+ := \text{Hom}(M, \Lambda)$ . There is a canonical map

$$\Phi : M \rightarrow M^{++}, \quad m \mapsto (\varphi \in M^+ \mapsto \varphi(m))$$

Let  $T_1(M) = \ker \Phi$ . Since  $M$  is contained in  $\Lambda^s$ , we claim that  $T_1(M) = 0$ . Indeed, fix an inclusion  $\iota : M \hookrightarrow \Lambda^s$  and denote by  $\pi^i : \Lambda^s \rightarrow \Lambda$  the projection at the  $i^{\text{th}}$  coordinate. Let  $m \in M \setminus \{0\}$ . Then there is some  $j \in \{1, \dots, s\}$  such that the  $j^{\text{th}}$  coordinate of  $\iota(m)$  is non-zero. Then

$$\Phi(m)(\pi^j \circ \iota) = \pi_j(\iota(m)) \neq 0$$

Thus  $m \notin T_1(M)$  and the proof of the claim is complete.

By [NSW00, Corollary 5.5.9],  $\text{Ext}^1(M, \Lambda)$  is finite.  $\square$

**Lemma A.2.3.** Let  $N \subset M$  be  $\Lambda$  modules such that  $N$  has finite index in  $M$ . Then  $N^* = M^*$ .

*Proof.* There is an exact sequence

$$(M/N)^* \longrightarrow M^* \longrightarrow N^* \longrightarrow \text{Ext}^1(M/N, \Lambda)$$

Since  $M/N$  is finite, then both  $(M/N)^*$  and  $\text{Ext}^1(M/N, \Lambda)$  vanish. Indeed,  $(M/N)^* = 0$  since  $\Lambda$  does not contain elements of finite order and  $\text{Ext}^1(M/N, \Lambda) = 0$  by [NSW00, Corollary 5.5.4]  $\square$

*Proof of proposition A.2.1.* Let  $I$  be the image of the map  $N \rightarrow M$  inside  $\Lambda^s$ . By lemma A.2.2,  $\text{Ext}^1(I, \Lambda)$  is finite. There is an exact sequence

$$\Lambda^s \longrightarrow M^* \longrightarrow N^* \longrightarrow \text{Ext}^1(I, \Lambda)$$

Call  $J$  to the image of  $M^*$  inside  $N^*$ , which has finite index in  $N^*$  because of the finiteness of  $\text{Ext}^1(I, \Lambda)$ . The exact sequence

$$\Lambda^s \longrightarrow M^* \longrightarrow J \longrightarrow 0$$

induces a canonical map

$$\bigwedge^r J \rightarrow \bigwedge^{r+s} M^*$$

The dual of this map is

$$\bigcap^{r+s} M^* \rightarrow \text{Hom} \left( \bigwedge^r J, \Lambda \right)$$

Since  $\bigwedge^r J$  has finite index in  $\bigwedge^r N^*$ , lemma A.2.3 implies that their duals are equal, so the above map can be rewritten as

$$\bigcap^{r+s} M^* \rightarrow \bigcap^r N^*$$

$\square$

**Proposition A.2.4.** Consider the exact sequence of  $\Lambda$ -modules

$$0 \longrightarrow N \longrightarrow \Lambda^{r+s} \longrightarrow \Lambda^s \longrightarrow M \longrightarrow 0$$

Let  $\varphi$  be a generator of  $\bigcap^{r+s} \Lambda^{r+s}$  and let

$$\Phi : \bigcap^{r+s} \Lambda^{r+s} \rightarrow \bigcap^r N$$

be the map constructed in proposition A.2.1. Then the image of  $\Phi(\varphi) \in \text{Hom} \left( \bigwedge^r N^*, \Lambda \right)$  contains the  $0^{\text{th}}$  Fitting ideal of  $M$ .

*Proof.* Let  $\Psi$  be the composition of the following maps

$$\bigwedge^r (\Lambda^{r+s})^* \longrightarrow \bigwedge^r N^* \longrightarrow \bigwedge^{s+t} (\Lambda^{r+s})^* \xrightarrow{\varphi} \Lambda$$

where the first map is induced by the homomorphism  $(\Lambda^{r+s})^* \rightarrow N^*$  and has finite cokernel, the second map is the one constructed in the proof of A.2.1. Since  $\Phi(\varphi)$  is the composition of the last two maps, its image contains the image of  $\Psi$  with finite index. The proof concludes by noticing the image of  $\Psi$  coincides with the 0<sup>th</sup> Fitting ideal of  $M$ .  $\square$
